For over 45 years, Helac Corporation has been recognized for innovation in design of hydraulic rotary actuators and construction equipment attachments. Helac products are known for their tremendous torque output, compact configurations, exceptional load bearing capabilities, and rugged, reliable performance. Over 1,000 mobile, industrial, construction and mining machinery manufacturers around the world depend on Helac actuators to perform such functions as rotation, positioning, manipulation, vehicle steering and indexing.

The L30 Series is available in several different sizes. All L30 Series actuators incorporate the same internal design, though they vary in size depending on model.
General Safety Guidelines

Many L30 actuator applications have several pinch points with the potential for severe injuries. Use extreme caution and remain clear of all rotating components when bleeding the hydraulic system and whenever the machine is in operation.

After rebuilding or repairing an actuator, it is necessary to bleed all air from the actuator as well as the hydraulic system of the machine.

Product Identification

Each Helac actuator is individually serial numbered. The serial number is a six digit number and must be provided before parts and/or service issues can be addressed.

The serial number can be found on the Identification (ID) Tag that is affixed to all actuators. The tag is a thin, silver colored, plastic label with a self-adhesive backing. Information is imprinted in black. The tag is located on the housing tube of the actuator. In some cases, the ID tag may be painted over by the OEM (Original Equipment Manufacturer). Additionally, the serial number of the actuator is stamped onto the housing tube. It may be necessary to remove paint to expose the serial number.
Theory of Operation

The L30 Series rotary actuator is a simple mechanism that uses Helac's sliding spline technology which converts linear piston motion into powerful shaft rotation. Each actuator is composed of a housing with an integral ring gear (1) and only two moving parts: the central shaft (2) with an integrated bearing and mounting flange, and the annular piston sleeve (3).

Helical spline teeth machined on the shaft engage matching splines on the inside diameter of the piston. The outside diameter of the piston carries a second set of splines, of opposite hand, which engage the matching splines of the housing's ring gear.

As hydraulic pressure is applied, the piston is displaced axially within the housing - similar to the operation of a hydraulic cylinder - while simultaneously, the splines cause the shaft to rotate. When the control valve is closed, oil is trapped inside the housing, preventing piston movement and locking the shaft firmly in position.

The shaft is supported radially by the large upper radial bearing and the lower radial bearing (see drawings on pages 8 and 9). Axially, the shaft is separated from the housing by the upper and lower thrust washers. The end cap is adjusted for axial clearance and locked in position by set screws, pins or locking collar.

The L30 Series is available in several different sizes. All L30 Series actuators incorporate the same internal design, though they vary in size depending on model.

Many actuators are equipped with a factory installed counterbalance valve, which performs four major functions.

- Protects the actuator in the event of overload
- Enables the actuator to hold position without drifting when external loads are applied
- Reduces hydraulic backlash by pressuring the hydraulic fluid
- Provides a constant controlled rate of rotation in over-center load conditions

Bars indicate starting positions of piston and shaft. Arrows indicate direction they will rotate. The housing with integral ring gear remains stationary. For clarity, the shaft flange, bearings, and end cap are not shown.

Applying fluid pressure will displace the piston axially while the helical gearing causes the piston and shaft to rotate simultaneously. The double helix design compounds rotation: shaft rotation is about twice that of the piston. Applying pressure to the opposite port will return the piston and shaft to their original starting positions.
Tools Required

Several basic tools are required for the disassembly and reassembly of the actuator. The tools and their intended functions are outlined below:

1. PIPE VISE
2. BOLTS
3. PRY BAR
4. SCREWS
5. FLASHLIGHT
   Helps in locating and examining timing marks, component failure and overall condition.
6. HEX WRENCH SET
   Removal and replacement of port plugs and set screws
7. TORQUE TOOL
8. TORQUE WRENCHES
9. ASSORTED SCREWS
10. PLASTIC MANDREL
    Removal and installation of piston sleeve
11. FELT MARKER
    Highlights timing marks and outlines troubled areas. Permanent ink is recommended.
12. SAFETY GLASSES
13. SEAL TOOLS
14. RUBBER MALLET
    Removal and installation of shaft and piston sleeve assembly.

MAKING A SEAL TOOL

The seal tool is merely a customized standard flat head screwdriver.

1. Heat the flat end with a torch until it glows.
2. Secure the heated end of the screwdriver in a vise and bend the heated end to a slight radius.
3. Round off all sharp edges of the heated to a polished finish. The tool may be modified slightly to your own personal preference.

CAUTION

To avoid Injury:
Be careful when handling the screwdriver when hot.
Spare Parts

Spare parts must be ordered through the vehicle/machine OEM. Seals and bearings are available as complete kits only! In order to obtain the correct parts, it is essential to provide the serial number of the actuator to be repaired, see Product Identification section on page 4. To identify spare parts required, refer to the Assembly Drawing on page 9 and Parts List on page 10.

Technical Support

Technical support is available from Helac Corporation, Monday through Friday 7 am to 4 pm Pacific Standard Time by calling 800-327-2589. If possible, please have the serial number of the actuator available. (The serial number is stamped into the housing of the actuator-see page 4).

## Parts List

### Spare Parts

Spare parts must be ordered through the vehicle/machine OEM. Seals and wear guides are available as complete kits only! In order to obtain the correct parts, it is essential to provide the serial number for the actuator to be repaired. See Product Identification on Page 4. To identify spare parts required, refer to the Assembly Drawing, Exploded View Drawing and the Parts List.

Disassembly

Before Disassembly

All numbers that appear in parenthesis ( ) are referring to items on page 8 or 9.

Inspect the actuator for corrosion prior to disassembly. Severe corrosion can make it difficult to unthread and remove the lock nut (5) and end cap (4). If corrosion is evident, soak the effected areas with penetrating oil for several hours before disassembly. It is required prior to disassembly, that the shaft is rotated completely clockwise and that the valve block is removed, (See valve block drawing and parts list on page 10) and that the actuator is placed in a pipe vise.

Disassembly

Be sure actuator has been fully rotated, valve block removed, and actuator is firmly secured to the pipe vise.

1. Remove port plugs (106) and both grease relief and grease fittings (111 and 112) for ease of disassembly and assembly processes.

2. Drain the actuator of all oil into a suitable container.

3. Using a 3/16 " size hex wrench, remove the 4 port plugs (105) from the locknut (5).

4. Thread a #10-32 bolt into each pull-out dowel pin (109) located behind 2 of the port plugs (105) in the lock nut (5), pull straight out to remove.

5. Insert two SAE-4 adaptor fittings opposite each other into the lock nut (5). Place a pry bar between the adaptor fittings and turn counterclockwise to remove the lock nut (5) from the threaded end of the shaft (2).
Disassembly

6. Insert two 5/8"-11 threaded bolts opposite each other into the end cap (4). Pull straight out to remove end cap (4). See Photo Below

   NOTICE
   If needed, to break the seal friction, the end cap can be removed by first removing the shaft (see step 7) then tapping the inside of the end cap through the actuator housing and piston sleeve with a rubber mallet and plastic mandrel. Do not let end cap fall.

7. Thread two M16x2 threaded bolts into the shaft (2) flange. Using a long pry bar turn the shaft (2) counterclockwise. It will start to rotate out of the housing. If it does not rotate out of the housing, use a plastic mandrel to tap the threaded end to break the hydraulic lock and start the shaft out of the housing. (Do not rotate shaft out of gear engagement with the piston). Look on the gear end of the piston sleeve (3) and locate the existing timing marks (center punches), make new timing marks if needed. Take a felt pen and clearly mark the gear engagement at the timing marks on both the piston and shaft. Upon reassembly the same gear engagement (timing) has to be achieved. Rotate the shaft out of the actuator. Support the weight of the shaft to prevent damage to the rod surface. See Photos to Right.
Disassembly

8. Using a plastic mandrel and rubber mallet, drive the piston sleeve assembly towards the end cap end of the actuator. Stop when the gear end of the piston sleeve is flush with the Housing (1) ring gear.

9. Locate the timing marks on the piston sleeve assembly (3) and the housing (1) ring gear, clearly mark them with a felt pen (make new timing marks if none are found). Continue to drive the piston sleeve assembly out of the housing ring gear. Stop immediately after the gear teeth come out of engagement. Take a felt pen and put a mark on top of the piston and a corresponding mark on the thrust surface of the housing (see photo below). This mark will simplify assembly later. Remove the piston sleeve assembly from the housing.

Do not allow the piston to bind or jam in the housing bore. Support the weight of the piston to prevent damage to the housing bore.

10. Remove the OD O-ring (209) from the locknut (5) using a pick or seal tool.

11. Remove the ID O-ring (208) from the locknut (5) using a pick or seal tool.

12. Remove the ID cup seal (200) from the end cap (4) using a pick or seal tool.
Disassembly

13. Remove the wear guide (302) from the end cap (4).

14. Remove the main pressure seal (205) from the end cap (4) using a seal tool.

15. Remove the thrust washer (304) from the end cap (4).

16. Remove the exclusion seal (206) from the end cap (4) using a seal tool.

17. Remove the ID cup seal (200) from the piston sleeve assembly (3) using a seal tool.

18. Remove the ID wear guide (301) from the piston sleeve assembly (3) using a pick tool.
Disassembly

19. Remove the ID cup seal (201) from the piston sleeve assembly (3) using a small pick or seal tool.

20. Remove the wear guide (300) from the piston sleeve assembly (3).

21. Remove the OD cup seal (202) from the piston sleeve assembly (3) using a small pick or seal tool.

22. Remove the OD cup seal (203) from the piston sleeve assembly (3) using a small pick or seal tool.

23. Remove the wear guides (300 & 302) from the shaft (2).

24. Remove the main pressure seal (205) from the shaft (2) using a seal tool.
Disassembly

26. Remove the thrust washer (304) from the shaft (2).

27. Remove the exclusion seal (206) from the shaft (2) using a seal tool.
Seal and Wear Guide Installation

1. Using a seal tool install the OD O-ring (209) onto the locknut (5).

2. Install the ID O-ring (208) into the lock nut (5).

3. Install the ID cup seal (200) into the end cap (4).

Pre-Assembly

All actuators are timed according to OEM specifications at Helac's production facility. The timing ensures that the actuator will stop at the required position at the end of the rotation in either direction. Wrong timing can cause the actuator to over rotate resulting in interference and damage of equipment components. Rotation being too short can limit the operating range of the equipment. The proper gear engagement of shaft, piston and housing ensures the correct timing.

For repair personnel not familiar with the L30 actuator, it is recommended that a "dry run" without the seals installed but with the wear guides and thrust washer installed, be performed prior to final assembly. Proceed to assembly procedures starting on page 22, insure proper fit and timing of actuator, then disassemble and apply all seals and wear guides. For seal and wear guide orientation use the cut-away drawing on page 7 as a reference.

Inspection

1. Clean all parts in a wash tank and dry with compressed air prior to inspecting.

2. Carefully inspect all critical areas: Seal grooves, wear guide grooves, thrust surfaces, shaft surfaces, housing bore and gear teeth for any surface finish abnormalities.
Seal and Wear Guide Installation

4. Install the exclusion seal (206) onto the end cap (4) using a seal tool.

5. Lightly grease both sides of the thrust washer with Lithium grease (304) and install onto the end cap (4).

6. Install the main pressure seal (205) onto the end cap (4) using a seal tool.

7. Install the wear guide (302) onto the end cap (4).

8. Install the OD cup seal (203) with the energizer ring removed, onto the piston sleeve assembly (3) using a seal tool.

9. Install the OD cup seal (202) onto the piston sleeve assembly (3) using a seal tool.

* NOTE: Several models use O.D. T-seal that comes without an energizer ring. Install the O.D. seal and two backup rings.
Seal and Wear Guide Installation

10. Install the wear guide (300) onto the piston sleeve assembly (3).

11. Install the ID cup seal (201) with the energizer ring removed, into the piston sleeve assembly (3).

12. Install the ID wear guide (301) into the piston sleeve assembly (3).

13. Install the ID cup seal (200) into the piston sleeve assembly (3).

14. Install the exclusion seal (206) onto the shaft (2).

15. Lightly grease both sides of the thrust washer with Lithium grease (304) and install onto the shaft (2).
Seal and Wear Guide Installation

16. Install the main pressure seal (205) onto the shaft (2).

![Main pressure seal installation](image1)

17. Install wear guides (300 & 302) onto the shaft (2).

![Wear guide installation](image2)
Assembly

1. Secure the actuator to a pipe vise, then carefully slide the piston sleeve assembly (3), gear teeth first, into the end cap end of the actuator. (Be careful not to bind or jam the piston sleeve assembly in the housing). Stop when the end of the piston is flush with the thrust surface of the housing (1) and the two reference marks, made during disassembly line up. (The gear teeth of the piston sleeve assembly should be almost ready to engage the housing (1) ring gear teeth).

2. Confirm proper gear alignment from the shaft flange end, then use a rubber mallet and plastic mandrel to engage the piston sleeve assembly gear teeth and housing ring gear teeth. Drive piston in until the front of the piston sleeve is lined up with the housing ring gear (see photo below). Locate the timing marks on the piston sleeve gear teeth and the housing ring gear teeth. Both timing marks should be lined up. If not, disengage the piston from the ring gear and line up with the correct gear engagement.

3. Using a rubber mallet and plastic mandrel, continue to drive piston sleeve assembly (3) towards the shaft flange end of actuator until the piston sleeve assembly is fully seated against the housing ring gear.
**Assembly**

4. Install the shaft (2) threaded end first into the piston sleeve assembly (3). The shaft (2) gear teeth timing mark and the piston sleeve assembly (3) gear teeth timing mark must be lined up.

5. Install two M16x2 bolts into the shaft (2) flange. Using a long pry bar turn the shaft (2) clockwise. Be sure both timing marks on the gear teeth are lined up. Rotate shaft (2) in until approximately 2 inches are still between the shaft flange and the housing.

6. Grease the end cap (4) splines with Lithium grease. Install two 5/8"-11 bolts in the end cap and slide end cap into the housing. Carefully tap the end cap (4) with a rubber mallet until the seals enter the housing and the end cap becomes flush with the housing.

7. Using the pry bar turn the shaft (2) clockwise slowly to engage the shaft (2) splines and the end cap (4) splines. If needed, use the two bolts on the end cap to turn end cap for proper alignment of the splines. After engagement of splines, fully seat the shaft (2) clockwise into the housing.

---

**NOTICE**

*To avoid damage to machined parts: Carefully remove seals using removal tools with rounded edges.*
Assembly

8. Grease the threads and contact surfaces of the end cap (4), shaft (2) and locknut (5). Thread the locknut (5) onto the threaded end of the shaft (2). Install two SAE #4 adaptor fittings opposite each other into the locknut (5). Using the pry bar, turn lock nut clockwise and tighten, per chart on page 24.

9. Rotate the locknut (5) counterclockwise just far enough to insert the 2 pull-out dowel pins (109) opposite each other.

10. Install and tighten the 4 SAE-4 port plugs (105) into the locknut (5) using a \( \frac{3}{16}'' \) hex wrench.

11. Install the valve block (if equipped), hydraulic lines, all port plugs and grease fittings onto the actuator.

Greasing Thrust Washers

After the actuator is assembled but before it is put back into service, the thrust washers and exclusion seals must be packed with Lithium grease.

1. There are two male grease fittings (111) and two grease relief ports (112), one of each (111, 112) is located at both ends of the outer diameter of the housing (1). (See exploded view on page 8 for reference).

2. Insert the tip of the female grease nozzle onto the male grease fitting (111) and apply grease. Continue applying until grease flows from the relief port (112). Cycle the actuator five times and apply grease again. Repeat this process at the other end of the housing (1).

If a hydraulic test bench is not available, the actuator can be rotated by hand, open the pressure ports and use a pry bar with cap screws inserted into the shaft flange to turn the shaft in the desired direction.

Testing the Actuator

Testing the Actuator for Internal Leakage

Plug the valve ports and connect the hydraulic lines to the housing ports. Bleed all air from the actuator (see Installation and Bleeding Procedure on page 26) Rotate the shaft to the end of rotation at 3000 psi (210 bar) and maintain pressure. Remove the hydraulic line from the non-pressurized side. Continuous oil flow from the open housing port indicates internal leakage across the piston. Replace the line and rotate the shaft to the end of rotation in the opposite direction. Repeat the test procedure outlined above for the other port. If there is an internal leak, disassemble, inspect and repair.
Installation and Bleeding

After installation of the actuator onto the equipment, it is important that all safety devices such as tie rods or safety cables be properly reattached. The actuator body is equipped with a pair of port plugs (106) which can be removed for bleeding.

For actuators with an optional valve block installed.

1. Connect the pressure lines to ports V1 and V2.
2. Connect a hydraulic line to port P1 routed either back to tank or to a 5 gallon container to collect the purged oil.
3. Apply pressure to port V2 until actuator has fully rotated to one side.
4. With port P1 still open, apply pressure to the primary port V1 allowing oil/air to be purged from the open port.
5. Install port P1 plug and attach purge line to port P2.
6. Apply pressure to port V1 until actuator has fully rotated in the opposite direction.
7. With port P2 still open, apply pressure to port V2 allowing oil/air to be purged from the open port.
8. Install port P2 plug.
9. All air should be purged from the actuator.

For actuator without optional valve block installed.

Air should be purged through the upper ports P1 and P2. With that in mind, apply pressure hoses to the lower ports P1 and P2.

1. Connect a hydraulic line to upper port P1 routed either back to tank or to a 5 gallon container to collect the purged oil.
2. Apply pressure to lower port P2 until actuator has fully rotated to one side.
3. With upper port P1 still open, apply pressure to the lower port P1 allowing oil/air to be purged from the open port.
4. Install upper port P1 plug and attach purge line to upper port P2.
5. Apply pressure to lower port P1 until actuator has fully rotated to the opposite side.
6. With upper port P2 still open, apply pressure to the lower port P2 allowing oil/air to be purged from the open port.
7. Install upper port P2 plug.
8. All air should be purged from the actuator.
### Troubleshooting Guide

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>SEE CAUSES AND SOLUTIONS BELOW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shaft rotates slowly or not at all</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUSE</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Insufficient torque output</td>
<td>Verify correct operating pressure. Do not exceed OEM's pressure specifications. Load may be above maximum capacity of the actuator.</td>
</tr>
<tr>
<td>2. Low rate of fluid flow</td>
<td>Inspect ports for obstructions and hydraulic lines for restrictions and leaks.</td>
</tr>
<tr>
<td>3. Control or counterbalance valve has internal leak</td>
<td>Disconnect hydraulic lines and bypass valve. Leave valve ports open and operate the actuator through housing ports (do not exceed OEM's operating pressure). The valve must be replaced if a steady flow of fluid is seen coming from the valve ports.</td>
</tr>
<tr>
<td>4. Piston and/or shaft seal leak</td>
<td>Remove the plug and the housing's valve ports. Operate the actuator through the housing ports. Conduct the internal leakage test as described in the Testing section on page 23 of this manual.</td>
</tr>
<tr>
<td>5. Corrosion build-up on the thrust surfaces</td>
<td>Re-build the actuator. Remove all rust then polish.*</td>
</tr>
<tr>
<td>6. Swollen seals and composite bearings caused by incompatible hydraulic fluid (Standard actuators only)</td>
<td>Re-build the actuator. Use fluid that is compatible with seals and bearings. Contact Helac Corporation for more information.</td>
</tr>
<tr>
<td>7. Air in actuator</td>
<td>Purge air from actuator. See bleeding procedures outlined on page 24.</td>
</tr>
<tr>
<td>8. Twisted or chipped gear teeth overload condition.</td>
<td>Check for gear binding. Actuator may not be able to be re-built and may need to be replaced.</td>
</tr>
<tr>
<td>9. Port fittings are obstructing the piston during stroke</td>
<td>Check thread length of port fittings. Fittings should not reach inside the housing bore.</td>
</tr>
</tbody>
</table>

* Replacement parts may be needed.
Offer of Sale

The items described in this document and other documents and descriptions provided by Parker Hannifin Corporation, its subsidiaries, and its authorized distributors (“Seller”) are hereby offered for sale at prices to be established by Seller in its sole discretion and subject to the Terms and Conditions. Buyer’s offer for any item described in this document, when communicated to Seller verbally, in writing, or in any other form, shall constitute acceptance of this offer. All goods, services or work described will be referred to as “Products.”

1. Terms. All sales of Products by Seller are expressly conditioned upon, and will be governed by the acceptance of, these Terms. These Terms are incorporated into any Quote provided by Seller to Buyer. Buyer’s order for any Products shall be deemed accepted by Seller (and Buyer will be bound by all of them) only if Buyer expressly states its acceptance in writing and signed by an authorized representative of Seller.

2. Price; Payment. The Products set forth in the Quote are offered for sale at the prices indicated in the Quote. Unless otherwise specifically stated in the Quote, the prices are valid for thirty (30) days after the date of the Quote and do not include any sales, use, or other taxes or duties, or other charges levied by any governmental jurisdiction. The Prices do not include insurance for shipment to the designated delivery location prepared by Seller and added as a separate line item to the invoice. Buyer shall be responsible for any additional shipping charges incurred by Seller due to Buyer’s acts or omissions. Buyer shall not return or repurchase any Products without the prior written authorization of Seller. Buyer shall pay all amounts due within a reasonable period of time (28 days) from the date of Seller’s invoice. If Buyer fails to pay any amounts due within such a period, Seller shall charge interest on such amounts at the rate of 1.5% per month or the maximum allowable rate under applicable law.

3. Shipment, Delivery, Title and Risk of Loss. All delivery dates are approximate, and Seller is not responsible for damages resulting from any delay. Regardless of the manner of shipment, delivery occurs and title and risk of loss or damage pass to Buyer upon acceptance of the Products with the carrier at Seller’s facility. Unless otherwise expressly stated in the Quote, title to all Products shall pass to Buyer in Seller’s facility when produced, and Seller reserves the right to make partial shipments. Buyer shall promptly inspect all Products upon receipt. No claims for shortages, defects or non-conformity will be entertained after thirty (30) days from the date of delivery.

4. Warranty. The warranty for the Products is as follows: (i) Goods are warranted against defects in material or workmanship for a period of eighteen (18) months from the date of delivery or 2,000 hours of use, whichever occurs first; (ii) Services shall be performed in accordance with generally accepted practices and the degree of skill ordinarily exercised and customarily accepted by the industry. Force majeure shall extend the date on which Warranty services are to be performed for a period of six (6) months from the date of completion of the Services; and (iii) Software is only warranted to perform in accordance with applicable specifications provided by Seller for nine (9) days from the date of delivery. In the event of non-conformance of a Product, Buyer shall notify Seller of such non-conformance within fifteen (15) days after Buyer’s receipt of such a Product. The following conditions are not covered by the warranty:

- Improper selection, design, specification, application, or misuse of the Products;
- Any act or omission, or use of Buyer or others of Buyer’s use of parts, tools, equipment, plans, drawings, designs, specifications, or other information or things furnished by Buyer;
- Damage to the Products from an external cause, repair or attempted repair by anyone other than Seller; failure to follow instructions, guides and specifications provided by Seller; or failure to provide proper maintenance or rework of the Products; and
- Buyer’s failure to comply with these Terms. Seller shall not indemnify Buyer under any circumstance described above, and no such provision shall prejudice either party’s right to enforce any other provision of these Terms.

10. Security Interest. Buyer agrees that its property may be sold or otherwise disposed of by Seller in whole or in part and any money received as a result of such sales or other disposals shall be credited to Buyer’s account. Buyer shall not record any security interest in the Products and Buyer represents to Seller that Buyer has never, and is not now in the process of, recording a security interest in the Products. Any security interests in the Products now recorded or hereafter recorded shall be subordinate to the security interest of Seller in the Products. The security interest given by Buyer to Seller shall be a first lien on all products described in the quoted categories upon which Buyer’s name appears in the Seller’s records, and Buyer represents to Seller that Buyer has no security interest in the Products that are the subject of the quoted or unquoted categories upon which Buyer’s name appears in the Seller’s records. Buyer acknowledges that Seller may obtain any other security interest in the Products, and Buyer agrees that Seller may, in its sole discretion, enforce such security interest.

11. User Responsibility. Buyer, through its own analysis and testing, is solely responsible for making the final determination as to whether the Products meet Buyer’s applicable industry standards, specifications, and any other technical or regulatory requirements, including those of any governmental authority. Buyer shall be responsible for determining that any such data and specifications are suitable and sufficient for all applications and reasonably foreseeable uses of the Products. In the event Buyer is not the end-user of the Products, Buyer shall ensure such end-user complies with this paragraph.

12. Use of Products. Indemnity by Buyer. Buyer shall comply with all instructions, guides and specifications provided by Seller in connection with the installation, use, maintenance and repair of the Products. Buyer agrees that Buyer will not use the Products in any manner that will void any warranty, indemnify, or make Buyer liable for any reason, at law or equity, to Buyer’s customers or any person or entity that will make Buyer liable for any reason, at law or equity, to Buyer’s customers or any person or entity. If Buyer uses or resists using the Products in any manner that will void any warranty, indemnify, or make Buyer liable for any reason, at law or equity, to Buyer’s customers or any person or entity, or if Seller requests Buyer to modify the Products, Buyer agrees that Buyer will promptly and reliably provide Seller all requested information or documents, including end-user statements and other written or oral communications, concerning Buyer’s ongoing-compliance with Export Laws.
