Thank you for your choice of Parker product. Please read this operating manual carefully and use the product correctly. Keep this operating manual in case questions about this product arise in future. If this operating manual becomes unreadable or lost, consult our distributors or Parker sales offices.

Safety instructions

The following safety precautions are provided to prevent personal injury and damage to property to and to provide instructions on the correct usage of this product. These precautions are classified into 3 categories: “CAUTION”, “WARNING”, and “DANGER” according to the severity of possible injury or damage and the likelihood of such injury or damage. Be sure to comply with all precautions. Also comply with safety regulations such as ISO 4414(*1), Industrial Safety and Health Law, and High Pressure Gas Safety Law.

| Danger: Indicates an impending hazardous situation which may result in serious personal injury or death. |
| Warning: Indicates a potentially hazardous situation which may result in serious personal injury or death. |
| Attention: Indicates a potentially hazardous situation which may arise due to improper handling or operation and could result in personal injury or property-damage-only accidents. |

*1 ISO 4414: Guidelines and pneumatic fluid power recommendations for pneumatic systems and their components.

Warning

- This product is designed for pneumatic devices.
  The applicability of pneumatic equipment to the intended system should be judged by the pneumatic system designer or the personnel who determined specifications for such system.
- Since the operating conditions
  for the products contained in this instruction are diversified, the applicability of pneumatic equipment to the intended system should be determined by the pneumatic system designer or the personnel who determined specifications for such a system. Before making a system, the system designer should thoroughly examine all specifications for such a system and also take into consideration the possibility of any trouble with the equipment.
- The pneumatic equipment should only be handled by persons who have sufficient knowledge and rich experience.
  Improper handling of compressed air will result in danger. Assembling, operation and maintenance of machinery using pneumatic equipment should be performed by persons who have sufficient knowledge and rich experience.
- Never operate machinery nor remove the equipment until safety is assured.
  Before checking or servicing machinery and equipment, be sure to check that steps for prevention of dropping or runway of the driven component have been completely taken.
  When removing the equipment, make sure that the above-mentioned safety measures have been done beforehand.
  Then turn off air supply and power to the system and purge compressed air in the system.
  When restarting machinery and equipment, check that proper prevention of malfunction has been provided for and then restart carefully.
- When using the pneumatic equipment in the following conditions or environments, take the proper safety measures and consult Parker before hand.

- Conditions and environments (other than specified) and outdoor use.
  Applications to nuclear power equipment, railroads, aircraft, vehicles, medical equipment, equipment connected with food and drink, amusement facilities and safety devices such as emergency interruption devices, clutch/brake circuits for a press and the likes. Applications which require extreme safety and will also greatly affect human and property.
  1) After piping to Air Saver Unit and while the supply air is shut off, fully close the ON time adjustment needle (clockwise rotation) and fully loosen the OFF time adjustment needle (counter clockwise rotation). Please use the dots for position indication of ON/OFF adjustment.
  2) Turn on air to the supply port, air should pass to the output port continuously.
  3) Slowly loosen the ON time adjustment needle in CCW direction. A pulsed air blow with short OFF time will start. It is suggested to stop rotating the ON time adjustment needle at around 3 turns (for ASV2000), 2 turns (for ASV5000), or 1.5 turns (for ASV13000 &15000) in CCW direction.
  4) ASV2000&ASV5000:
     Next, adjust the OFF time by slowly tightening the OFF time adjustment needle in CW direction. The OFF time of the pulsed air blow will get longer. It is suggested to stop rotating the OFF time adjustment needle at around 7 turns (for ASV2000 or 5 turns (for ASV5000). This should result in about 50% ON/OFF duty of pulsed air blow at 1.5Hz (ASV2000) or 2Hz (ASV5000).
  5) Use the procedure of 4) as a starting point, and make the frequency and duty adjustments required in your application by using the ON time and OFF time adjustment needles.
  6) Fix the adjustment position by tightening lock nuts on adjustment screws. Regarding repair and maintenance, please consult Parker.

* Adjust frequency of pulsed air to less than 5Hz (ASV2000&ASV5000), 0.1~1Hz (ASV13000&15000). If frequency of pulsed air is higher than 5 Hz (ASV2000&ASV5000), 1Hz (ASV13000&ASV15000), operation of the pneumatic circuit (logistic element) may become unstable.

Attention

- Be sure to cut air supply to Air Saver Unit when air blow is not used. Blown air may come out even if the ON/OFF time adjustment needles are fully tightened. This unit is not designed to be an “OFF” valve.
1. **General information**

This product is a pulse air generation unit with built-in soft seal (ASV5000), and metal seal pneumatic valve (ASV2000, ASV13000 & ASV15000). This product is mainly for reducing air consumption in air blowing applications.

2. **Ordering Information**

Please refer to our catalogue – Air Saver Unit.

**Note 1)** When ambient temperature of the unit goes below 5° C, complete dry air shall be supplied to prevent freezing.

**Note 2)** The featured Air Saver Units are external pilot operated unit. Therefore, during air blow operation, external pilot pressure should be more than 3 bar.

Please make sure to supply more than 3 bar for external pilot air port at all time.

3. **Specifications**

For more information, see Air Saver catalog.

4. **Pulse cycle adjustment**

**ASV2000**

- **ON time adjustment needle**
- **OFF time adjustment needle**

**ASV5000**

- **ON time adjustment needle**
- **OFF time adjustment needle**

**ASV13000 & ASV15000**

- **ON time adjustment needle**
- **OFF time adjustment needle**

5. **Notes for intended use**

**A)** Before commissioning of piping

Thoroughly flush the inside of any pipes to remove chips, coolant, dust, etc.

**B)** Air quality

2) If it is difficult to make filter drain management periodically, Parker recommends setting up an air filter with automatic drain mechanism.

3) Be sure to take proper maintenance for a compressor. If sludge produced in compressor oil enters pneumatic equipment, it will cause operation failure of pneumatic equipment. Parker recommends setting up a coalescing filter after a filter.

**C)** Pneumatic circuit

This unit is an external pilot operated valve. To avoid malfunctions due to pressure drops, the external pilot air pressure must be more than 3 bar at all times. To avoid pressure drops during air blowing process, set up relatively higher supply pressure and use tubes with proper diameter.

**D)** Stopping the air blow

Be sure to cut air supply to Air Saver Unit when air blow is not used. Blown air may come out even if the ON/OFF time adjustment needles are fully tightened.

**E)** Lubrication

This product does not require lubricated air. Please do not lubricate it.

6. **Error correction**

**a)** Failure and countermeasure

<table>
<thead>
<tr>
<th>Failure condition</th>

7. **Maintenance and dismantling**

Regarding repair and maintenance, please consult Parker.

As a general rule, do not attempt maintenance or disassemble. If it is absolutely necessary to do maintenance work, keep the following points in mind.

1) Make sure that the actuators such as cylinders will not cause damage if they move.
2) Cut off electricity.
3) Cut off pneumatic pressure and exhaust air in the line.
4) Clean up the surroundings of the valve.

**Attention**

- Any attempt to repair and/or disassembling of the product by the user violates the warranty. Parker does not take any responsibility for damage and injury caused by it.

**Note**

Any request of after-service or maintenance parts, please contact our distributors or Parker customer service. Keep this operation manual. This operation manual would be changed without notice. Please check the newest version.

Only for ASV13000 & 15000: Confirm “Continuous/Pulse Needle” is fully opened before adjusting pulse cycles.

1) Do not supply air to the unit when adjusting the Continuous/Pulse needle.
2) The “Continuous/Pulse Needle” should be fully opened by loosing the needle in CCW direction, and fix its position by a lock nut (Shipment condition).
3) When the “Continuous/Pulse Needle” is fully closed, the main valve position keeps the “ON” condition and does not create pulsed blow.

**Pin adjustment for continuous / pulse operation. ASV13000 & ASV15000**

OFF (air is blown continuously)  ON (pulse blow)
