

Servomotors

NX Series

Technical Manual

PVD 3663

EU DECLARATION OF CONFORMITY

We ,

Parker Hannifin Manufacturing France SAS
Electric Motion & Pneumatic Division
Etablissement de Longvic
4 Boulevard Eiffel - CS40090
21604 LONGVIC Cedex - France

manufacturer, with brand name Parker, declare under our sole responsibility that the products

BRUSHLESS SERVOMOTORS TYPE NX1 / NX2 / NX3 / NX4 / NX6 / NX8

satisfy the arrangements of the directives :

Directive 2014/35/EU : "Low Voltage Directive", LVD

Directive 2011/65/EU + delegated Directive (EU) 2015/863: RoHS 3 "Restriction of Hazardous Substances"

Directive 2014/30/EU : "Electromagnetic Compatibility", EMC

and meet standards or normative document according to :

IEC 60034-1:2017 : Rotating electrical machines - Part 1 : Rating and performance.

IEC 60034-5:2020 : Rotating electrical machines - Part 5 : Degrees of protection provided by the integral design of rotating electrical machines (IP code) - Classification.

IEC 60204-1:2016 : Safety of machinery – Electrical equipment of machines – Part 1 : General requirements.

The product itself is not impacted by the modifications made on the latest directives.

The undersigned certify that the above mentioned model is procured in accordance with the above directives and standards.

Further information :

SERVOMOTORS shall be mounted on a mechanical support providing good heat conduction and not exceeding 40° C in the vicinity of the motor flange.

The product must be installed in accordance with the instructions and recommendations contained in the operating instructions supplied with the product.

NX1 C.E. Marking : October 2004

NX2 C.E. Marking : November 2004

NX3 C.E. Marking : September 27th 2001

NX4 C.E. Marking : March 15th 2000

NX6 C.E. Marking : March 27th 2000

NX8 C.E. Marking : December 23th 2003

Longvic, June 11th 2021

In the name of Parker

Compliance with «UL» standards

CERTIFICATE OF COMPLIANCE

Certificate Number 20151001-E242959
Report Reference E242959-20060112
Issue Date 2015-OCTOBER-01

Issued to: PARKER HANNIFIN MANUFACTURING FRANCE SAS
ESTABLISHMENT LONGVIC
4 Bd EIFFEL
21600 LONGVIC FRANCE

**This is to certify that
representative samples of**

COMPONENT - INCOMPLETE ROTATING MACHINES
AND ROTATING MACHINE PARTS
COMPONENT - SERVO AND STEPPER MOTORS
Brushless servo motor - Models NX 110, NX205, NX 210
followed by A; followed by A through Z, followed A through
Z, followed by R or B, followed by code 1,2,3,4,7 followed
by code 0 through 5 or A through F, followed by code 00
through 99

Have been investigated by UL in accordance with the
Standard(s) indicated on this Certificate.

Standard(s) for Safety: UL 1004-1, Rotating Electrical Machines - General
Requirements
C22.2 No. 100-04, Motors and Generators

Additional Information: See the UL Online Certifications Directory at
www.ul.com/database for additional information

Only those products bearing the UL Certification Mark should be considered as being covered by UL's
Certification and Follow-Up Service.

Recognized components are incomplete in certain constructional features or restricted in performance
capabilities and are intended for use as components of complete equipment submitted for investigation rather
than for direct separate installation in the field. The final acceptance of the component is dependent upon its
installation and use in complete equipment submitted to UL LLC.

Look for the UL Certification Mark on the product.

Bruce Mahrenholz, Director North American Certification Program

UL LLC

Any information and documentation involving UL Mark services are provided on behalf of UL LLC (UL) or any authorized licensee of UL. For questions, please
contact a local UL Customer Service Representative at <http://ul.com/about/locations/>

1. INTRODUCTION

1.1. Purpose and intended audience

This manual contains information that must be observed to select, install, operate and maintain PARKER NX servomotors.

Installation, operation and maintenance of the equipment should be carried out by qualified personnel. A qualified person is someone who is technically competent and familiar with all safety information and established safety practices; with the installation process, operation and maintenance of this equipment; and with all the hazards involved.

Reading and understanding the information described in this document is mandatory before carrying out any operation on the motors. If any malfunction or technical problem occurs, that has not been dealt with in this manual, please contact PARKER for technical assistance. In case of missing information or doubts regarding the installation procedures, safety instructions or any other issue tackled in this manual, please contact PARKER as well.

PARKER's responsibility is limited to its servomotors and does not encompass the whole user's system. Data provided in this manual are for product description only and may not be guaranteed, unless expressly mentioned in a contract.

DANGER: PARKER declines responsibility for any industrial accident or material damage that may arise, if the procedures and safety instructions described in this manual are not scrupulously followed.

1.2. Safety

1.2.1. Principle

To operate safely, this equipment must be transported, stored, handled, installed and serviced correctly. Following the safety instructions described in each section of this document is mandatory. Servomotors usage must also comply with all applicable standards, national directives and factory instructions in force.

DANGER: Non-compliance with safety instructions, legal and technical regulations in force may lead to physical injuries or death, as well as damages to the property and the environment.

1.2.2. General Safety Rules

	<p>Generality DANGER: The installation, commission and operation must be performed by qualified personnel, in conjunction with this documentation.</p> <p>The qualified personnel must know the safety (C18510 authorization, standard VDE 0105 or IEC 0364) and local regulations.</p> <p>They must be authorized to install, commission and operate in accordance with established practices and standards.</p>
	<p>Electrical hazard Servo drives may contain non-insulated live AC or DC components. Respect the drives commissioning manual. Users are advised to guard against access to live parts before installing the equipment.</p> <p>Some parts of the motor or installation elements can be subjected to dangerous voltages, when the motor is driven by the inverter , when the motor rotor is manually rotated, when the motor is driven by its load, when the motor is at standstill or stopped.</p> <p>For measurements use only a meter to IEC 61010 (CAT III or higher). Always begin using the highest range. CAT I and CAT II meters must not be used on this product.</p> <p>Allow at least 5 minutes for the drive's capacitors to discharge to safe voltage levels (<50V). Use the specified meter capable of measuring up to 1000V dc & ac rms to confirm that less than 50V is present between all power terminals and between power terminals and earth.</p> <p>The motor must be permanently connected to an appropriate safety earth. The continuity of the grounding circuit has to be checked on the complete circuit : the resistance between any conductive point and the grounding conductor shall not exceed more than 100mΩ</p> <p>To prevent any accidental contact with live components, it is necessary to check that cables are not damaged, stripped or not in contact with a rotating part of the machine. The work place must be clean, dry.</p> <p>General recommendations :</p> <ul style="list-style-type: none"> - Check the wiring circuit - Lock the electrical cabinets - Use standardized equipment
	<p>Mechanical hazard Servomotors can accelerate in milliseconds. Running the motor can lead to other sections of the machine moving dangerously. Moving parts must be screened off to prevent operators coming into contact with them. The working procedure must allow the operator to keep well clear of the danger area.</p>
	<p>Burning Hazard Always bear in mind that some parts of the surface of the motor can reach temperatures exceeding 100°C.</p>

2. PRODUCT DESCRIPTION

2.1. Quick URL

All informations and datas are available on :

<http://www.parker.com/eme/nx>

2.2. Overview

NX servomotors Series from PARKER is an innovative direct drive solution designed for industrial applications. NX Series brushless servomotors from Parker SSD Parvex combine exceptional precision and motion quality, high dynamic performances and very compact dimensions.

A large set of torque / speed characteristics, options and customization possibilities are available, making NX Series servomotors the ideal solution for most servosystems applications.

Advantages

- High precision
- High motion quality
- High dynamic performances
- Compact dimensions and robustness
- Large set of options and customization possibilities
- CE and UL marking certification available.

2.3. Applications

Medical: Blood pumps, air pump, radiology tables,...

Machine tools: Ancillary axis, spindle, axis...

Semiconductor

Hand tool: screwdriver,...

Packaging machinery

Robot applications

Special machines

Pumps

2.4. General Technical Data

	NX3, NX4, NX6	NX8
Motor type	Permanent-magnet synchronous motor	
Magnets material	Neodymium Iron Boron	
Number of poles	10	
Type of construction	IMB5 – IMV1 – IMV3 (EN60034-7)	
Degree of protection	<ul style="list-style-type: none"> • IP64, • IP65 in option 	<ul style="list-style-type: none"> • IP64, • IP65 in option • IP44 in fan cooled version
Cooling	<ul style="list-style-type: none"> • Natural cooling 	<ul style="list-style-type: none"> • Natural cooling, • Fan cooled • Water cooled
Rated voltage	230VAC, 400 VAC and 480 VAC	
Insulation of the stator winding	Class F according to IEC 60034-1	Class F according to IEC 60034-1 with potting
Altitude	Up to 1000m (IEC 60034-1) (for higher altitude see §3.1.1 for derating)	
Ambiant temperature	<ul style="list-style-type: none"> • -15°C to +40°C (IEC 60034-1) • 0°C to 40°C for water cooled version (IEC 60034-1) to avoid condensation see §3.5 	
Storage temperature	-20... +60°C	
Vibration severity	Grade A according to IEC 60034-14	
Shaft	Plain shaft as standard – key on shaft as an option	
Connection	<ul style="list-style-type: none"> • Connector • Cable (Not UL) on request • Flying wires (Not UL) on request 	<ul style="list-style-type: none"> • Connectors • Terminal box only NX8
Marking	<ul style="list-style-type: none"> • CE, • UL as an option 	<ul style="list-style-type: none"> • CE, • UL as an option
Paint finish	Raw as a standard, Black RAL 9005 as an option	
Sensor	Resolver transformation ratio = 0.5 as standard	
Hiperface - SKS36	Option	
Hiperface - SKM36	Option	
Hiperface DSL EKS36	Option	
Hiperface DSL EKM36	Option	
Incremental 2048line	On request	
Sensorless	On request	
Brake	Parking brake as an option	
Thermal protection	PTC or KTY as an option	
Remark	Numerous customization are possible on request (special shaft, connection, encoder, ...)

Note: All associations are not possible – Contact Parker for checking.

3. TECHNICAL DATA

3.1. Motor selection

3.1.1. NX standard atmospheric conditions

NX motors are designed to operate in inside area:

- air with normal oxygen content, typically 21 % v/v.
- air with a maximum relative humidity of 80%, without condensation.

In other conditions, like outside environment, please consult us.

3.1.2. Altitude derating

From 0 to 1000 m : no derating

1000 to 4000 m: torque derating of 5% for each step of 1000 m for water cooled

1000 to 4000 m: torque derating of 10% for each step of 1000 m for air cooled

3.1.3. Temperature derating

3.1.3.1. Natural cooled motor

The maximal temperature for natural cooling is 40°C. But, it is possible to increase a little bit the ambient temperature above 40°C, with a torque reduction. The following formula gives an indicative about the torque derating at low speed. But in any case refer to PARKER technical department to know the exact values

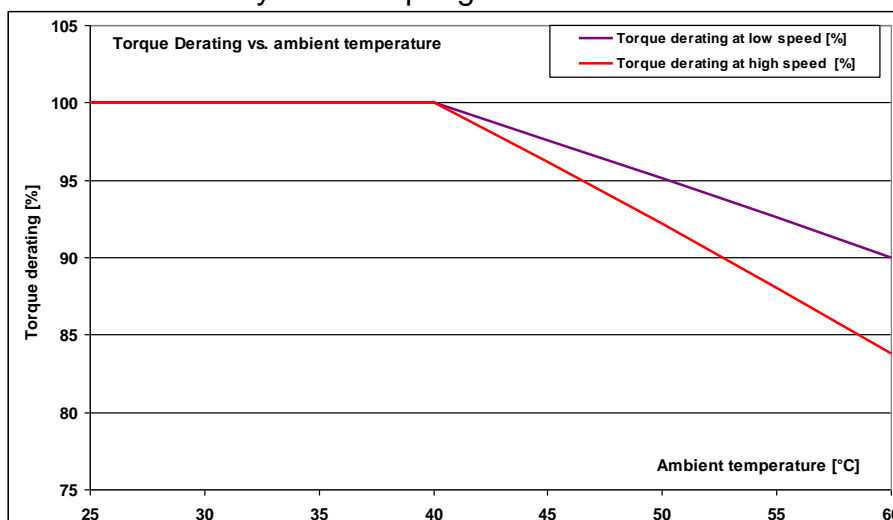

At low speed the torque derating is given by the following formula for an ambient temperature > 40°C.

$$\text{Torque_derating}[\%] = 100 * \sqrt{\frac{(145^{\circ}\text{C} - \text{Ambient_temperature}^{\circ}\text{C})}{105^{\circ}\text{C}}}$$

At high speed, the calculation is more complex, and the derating is much more important. Please refer to PARKER to know the precise data of Torque derating according to ambient temperature at high speed for a specific motor.

Illustration: Only for example given for the NX620EAR :

3.1.3.2. Water cooled motor

Typical values are given with a water inlet temperature of 25°C and a temperature gradient Inlet-Outlet of 10°C. These references lead to a winding overheating of 95°C corresponding to a winding temperature of 120°C. Recommendations regarding condensation issues are given at § 3.5

It is possible to increase a little bit the Inlet temperature up to 40°C, but the torque must be reduced. The following formula gives an indicative of the torque derating at low speed. But in any case refer to PARKER technical department to know the exact values

At low speed the torque derating is given by the following formula for an water Inlet temperature > 25°C.

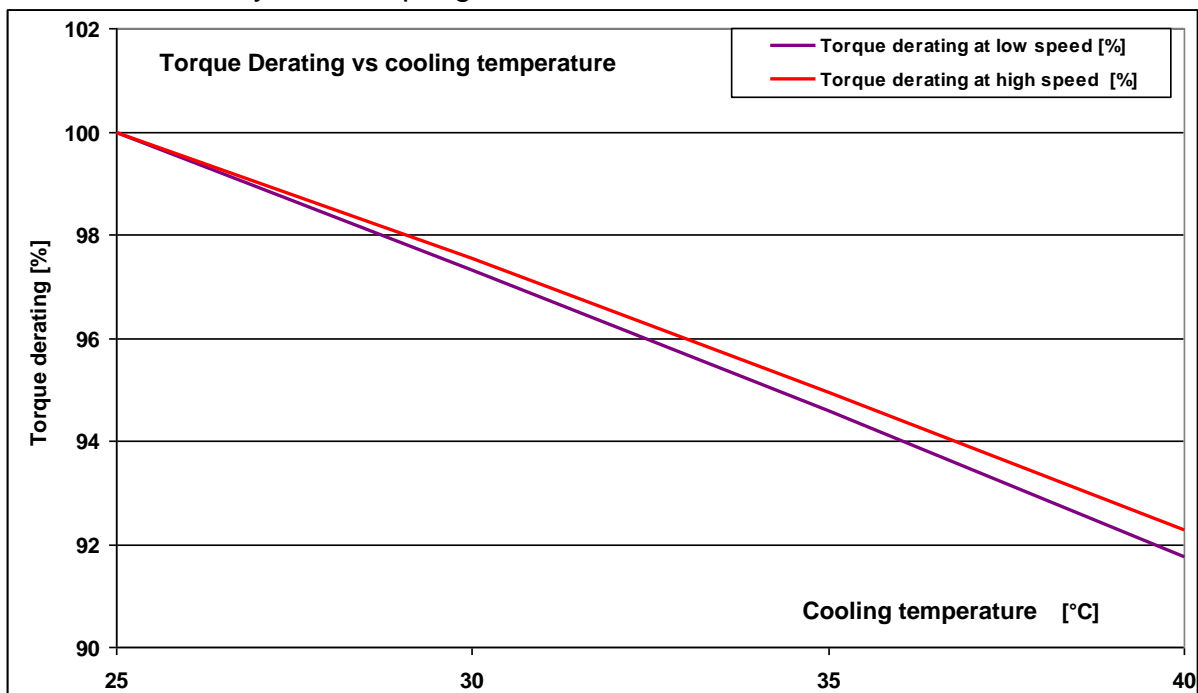

$$Torque_derating[\%] = 100 * \sqrt{\frac{(120^{\circ}C - Inlet_temperature^{\circ}C)}{95^{\circ}C}}$$

At high speed, the calculation is more complex, and the derating is much more important.

Please refer to PARKER to know the precise data of Torque derating according to water inlet temperature at high speed for a specific motor.

Illustration: Only for example given for the NX860WAF

3.1.4. Thermal equivalent torque (rms torque)

The selection of the right motor can be made through the calculation of the rms torque M_{rms} (i.e. root mean squared torque) (sometimes called equivalent torque).

This calculation does not take into account the thermal time constant. It can be used only if the overload time is much shorter than the copper thermal time constant.

The rms torque M_{rms} reflects the heating of the motor during its duty cycle.

Let us consider:

- the period of the cycle T [s],
- the successively samples of movements i characterized each ones by the maximal torque M_i [Nm] reached during the duration Δt_i [s].

So, the rms torque M_{rms} can be calculated through the following basic formula:

$$M_{rms} = \sqrt{\frac{1}{T} * \sum_{i=1}^n M_i^2 \Delta t_i}$$

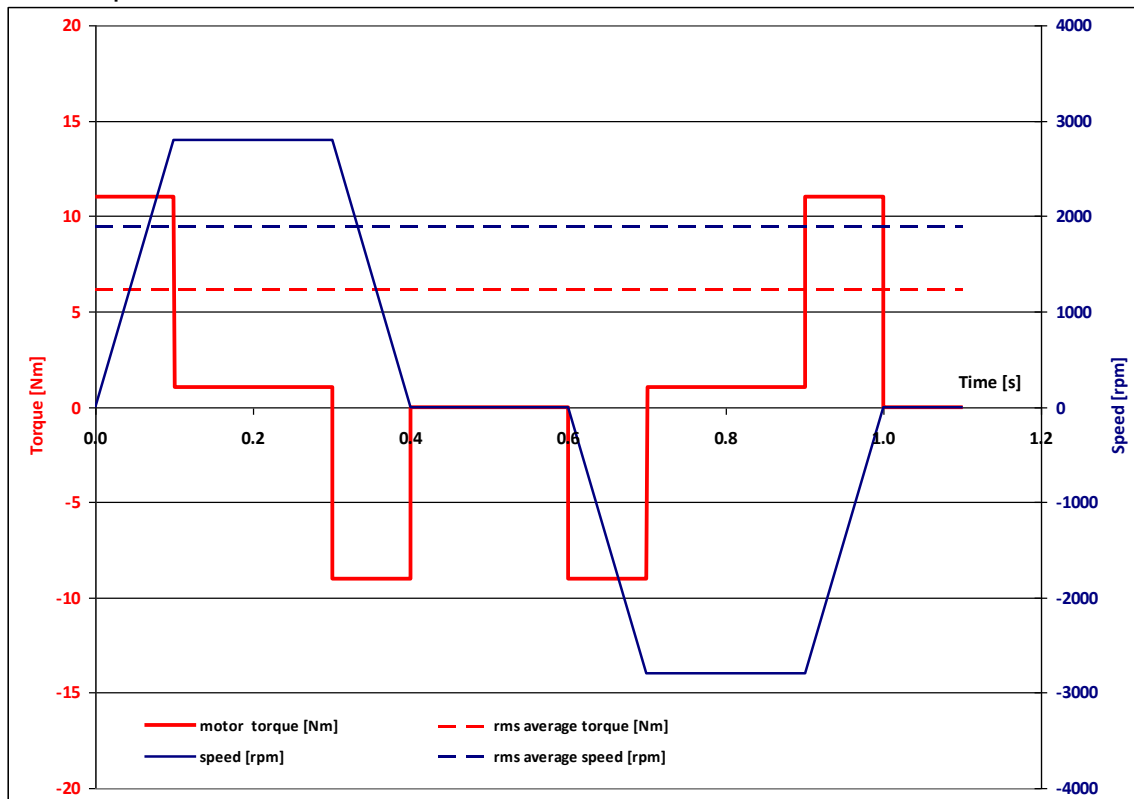

Example:

For a cycle of 2s at 0 Nm and 2s at 10Nm and a period of 4 s, the rms torque is

$$M_{rms} = \sqrt{\frac{1}{4} * 10^2 * 2} = 7,07 Nm$$

Illustration :

Acceleration-deceleration torque:	10 Nm for 0,1 s.
Resistant torque:	1 Nm during all the movement.
Max-min speed:	± 2800 rpm during 0,2 s.
Max torque provided by the motor:	11 Nm.
rms torque:	6 Nm.

The maximal torque M_i delivered by the motor at each segment i of movement is obtained by the algebraic sum of the acceleration-deceleration torque and the resistant torque. Therefore, M_{max} corresponds to the maximal value of M_i .

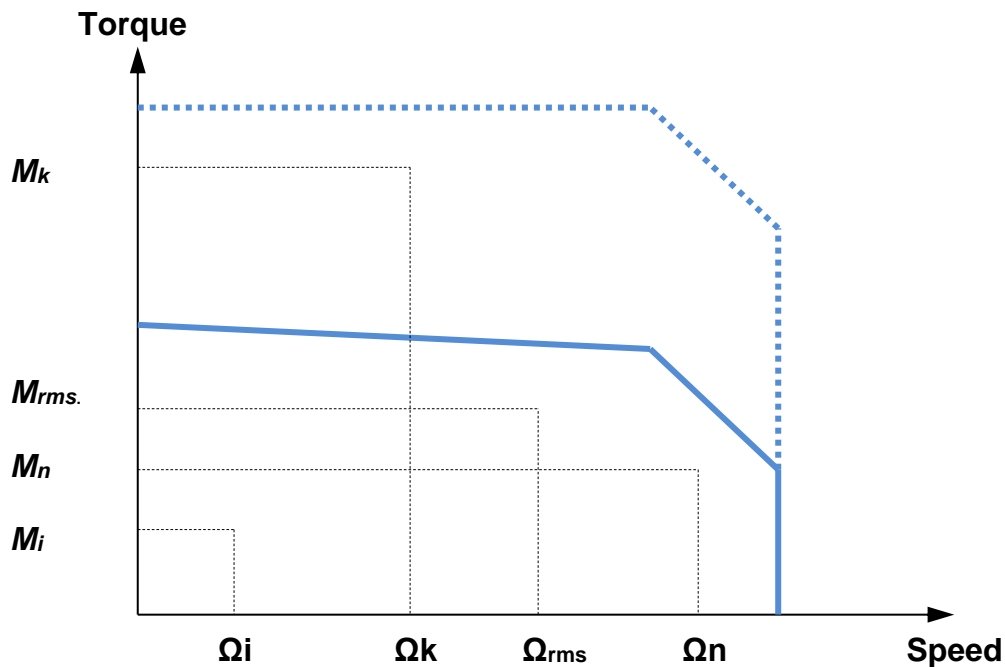

Selection of the motor :

The motor adapted to the duty cycle has to provide the rms torque M_{rms} at the rms speed(*) without extra heating. This means that the permanent torque M_n available at the average speed presents a sufficient margin regarding the rms torque M_{rms} .

$$\Omega_{rms} = \sqrt{\frac{1}{T} * \sum_{i=1}^n \Omega_i^2 \Delta t_i}$$

(*) rms speed is calculated thanks to the same formula as that used for the rms torque.
The mean speed cannot be used (in general mean speed is equal to zero).
Only use the rms speed.

Furthermore, each M_i and speed associated Ω_i of the duty cycle has to be located in the operational area of the torque vs speed curve.

3.1.5. Drive selection

Drive selection depends on its rated power and its mode selection which leads to the maximal current duration.

	<p>Please refer to the drive technical documentation for any further information and to select the best motor and drive association.</p>
---	--

AC890 PARKER drive example:

The rated current provided by the AC890 drive depends on its rated power and its mode selection. “Vector mode” is used for induction motors while “Servo mode” is used for brushless AC motors. With NX motors the power is usually < 37 kW, the rated current corresponds to 100 %.

Power of Drive AC890 [kW]	< 37 kW	
Mode	Vector mode	Servo mode
Overload capability [%]	150 % during 60 s	200 % during 4 s

Illustration:

Example n°1 :

The application needs:

- a rms torque of **7 Nm** at the rms speed of **2000 rpm**,
- an acceleration torque of **12 Nm**,
- a maximal speed of **2800 rpm**.

Selection of the motor:

The selected motor is the type **NX620EAR**.

The nominal speed is equals to 3900 rpm.

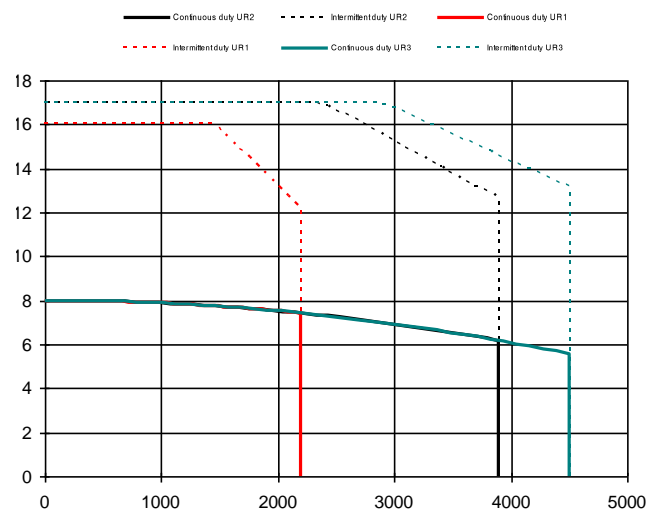

The maximal speed is equals to 3900 rpm.

The torque sensitivity is equals to 1.47 Nm/Arms.

BRUSHLESS MOTORS		
NX620EAR		
ELECTRONIC DRIVE (1)		
DIGIVEX 7.5/15 et DIGIVEX 8/16		
	(230V)	(400V) (480V)

Torque at low speed	M_0	Nm	8
Permanent current at low speed	I_0	A _{rms}	5.31
Peak torque	M_p	Nm	26.7
Current for the peak torque	I_p	A _{rms}	21.2
Back emf constant at 1000 rpm (25°C)*	K_e	V _{rms}	95.7
Torque sensitivity	K_t	Nm/A _{rms}	1.51
Winding resistance (25°C)*	R_b	Ω	2.24
Winding inductance*	L	mH	19.2
Rotor inertia	J	kgm ² x10 ⁻⁵	98
Thermal time constant	T_{th}	min	27
Motor mass	M	kg	7
Voltage of the mains	UR1 UR2 UR3	V _{rms}	230 400 480
Rated speed	Nn1 Nn2 Nn3	rpm	2200 3900 4500
Rated torque	Mn1 Mn2 Mn3	Nm	7.42 6.17 5.57
Rated current	In1 In2 In3	A _{rms}	4.99 4.25 3.89
Rated power	Pn1 Pn2 Pn3	W	1710 2520 2620

The permanent current I_0 of the motor is **5.31 Arms** for $M_0=8$ Nm at low speed.

The nominal current I_n of the motor is **4.25 Arms** for $M_n=6.17$ Nm at the nominal speed.

Selection of the drive:

The drive has to provide at least a permanent current equals to I_0 (5.31 Arms).

In order to obtain an acceleration torque of **12 Nm**, the current will be about 8 Arms (the motor data sheet shows 17 Nm with 11.3 Arms). This means that the drive has to provide at least 8 Arms as transient current.

→ Therefore, we can select the drive **AC890SD-53 2100 B** which delivers under 400 VAC:

6 Arms as permanent current and

6*200%=12 Arms as maximal transient current during 4 s.

The drive is set with **"Servo Mode"**.

→ We also can select the drive **DIGIVEX 8/16 Â** which delivers under 400 VAC:

5.6 Arms as permanent current and

5.6*200%=11.3 Arms as maximal transient current during 2 s.

Example n°2 :

This times; the application needs :

- a permanent torque of **5.8 Nm** at low speed,
- a rms torque of **5.8 Nm** at the rms speed of **1890 rpm**,
- an acceleration torque of **8.8 Nm**,
- a maximal speed of **2800 rpm**.

Selection of the motor:

The selected motor is the type **NX620EAR**.

The nominal speed is equals to 3900 rpm.

The maximal speed is equals to 3900 rpm.

The torque sensitivity is equals to 1.47 Nm/Arms.

Selection of the drive:

The drive has to provide a permanent current equals to 4 Arms to obtain 5.8 Nm.

In order to obtain an acceleration torque of **8.8 Nm**, the current will be of about 6 Arms

This means that the drive has to provide at less 6 Arms as transient current.

Compared to the previous example n°1, it is now possible to decrease the size of drive.

→ Therefore, we can select the drive **AC890SD-53 1600 B** which delivers under 400 VAC:

4 Arms as permanent current and

4*200%=8 Arms as maximal transient current during 4 s.

The drive is set with "**Servo Mode**".

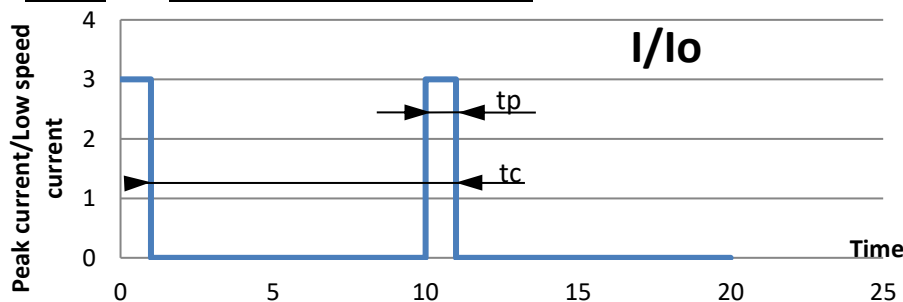

3.1.6. Current limitation at stall conditions (i.e. speed < 3 rpm)

Recommended reduced current at speed < 3 rpm:

$$I_{reduced} = \frac{1}{\sqrt{2}} * I_0 \cong 0.7 * I_0$$

	Warning: The current must be limited to the prescribed values. If the nominal torque has to be maintained at stop or low speed (< 3 rpm), imperatively limit the current to 70% of I_0 (permanent current at low speed), in order to avoid an excessive overheating of the motor.
	Please refer to the drive technical documentation for any further information and to choose functions to program the drive.

3.1.7. Peak current limitations

It is possible to use the NX motor with a current higher than the permanent current. But, to avoid any overheating, the following rules must be respected.

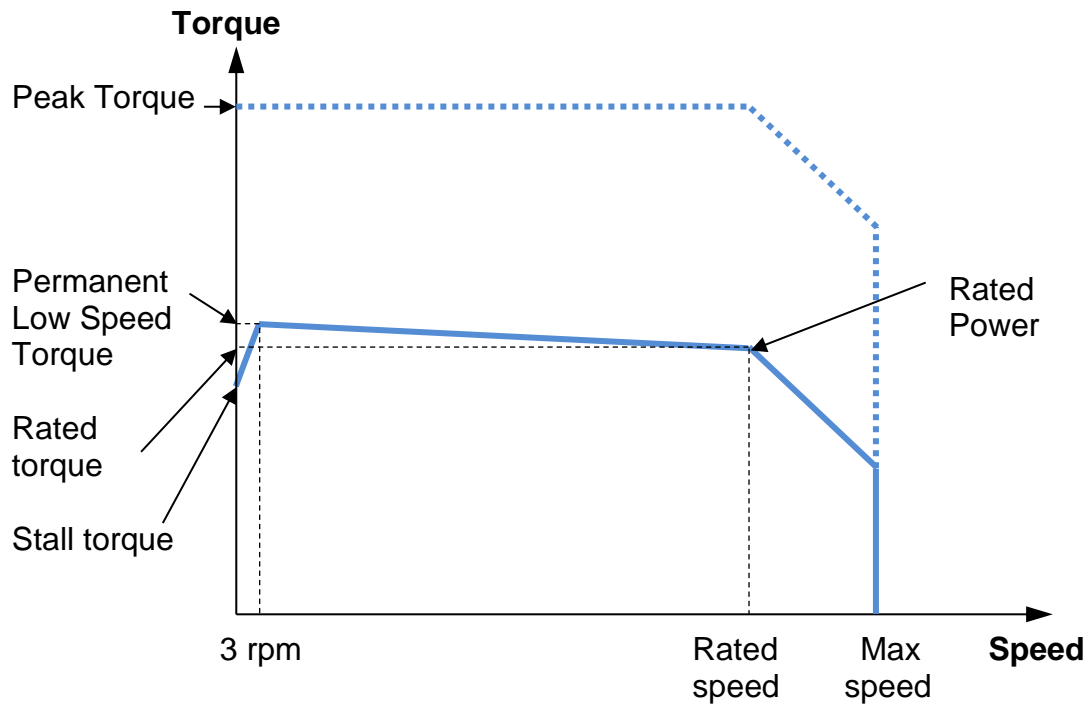

- 1) The peak currents and peak torques given in the data sheet must never be exceeded
- 2) The thermal equivalent torque must be respected (§3.1.3)
- 3) If 1) and 2) are respected (it can limit the peak current value or duration), the peak current duration (t_p) must be limited, in addition, accordingly to the following table (I_0 is the permanent current at low speed):

Ipeak/In	Ip/Io =2	Ip/Io = 3	Ip/Io =4	Ip/Io >5
NX310	tp<0.8 s	tp<0.3s	tp<0.15s	tp<0.1s
NX420				
NX430				
NX620	tp<1.5s	tp<0.6s	tp<0.3s	tp<0.2s
NX630				
NX820				
NX840				
NX860				
NX860V	tp<3s	tp<1.5s	not allowed	
NX860W				

The peak current duration is calculated for a temperature rise of 3°C
Consult us for more demanding applications.

3.2. NX Characteristics: Torque, speed, current, power...

The torque vs speed graph below explains different intrinsic values of the next tables.

3.2.1. NX datas – Mains voltage 230V

Motor	Rated Power P _n (kW)	Rated Torque M _n (Nm)	Rated Current I _n [Arms]	Low speed torque M ₀ [Nm]	Low speed Current I ₀ [Arms]	Peak Torque M _{peak} [Nm]	Peak Current I _{peak} [Arms]	Max. Speed N _{max} [rpm]

3.2.4. Efficiency curves

Caution: The efficiency curves are typical values. They may vary from one motor to an other

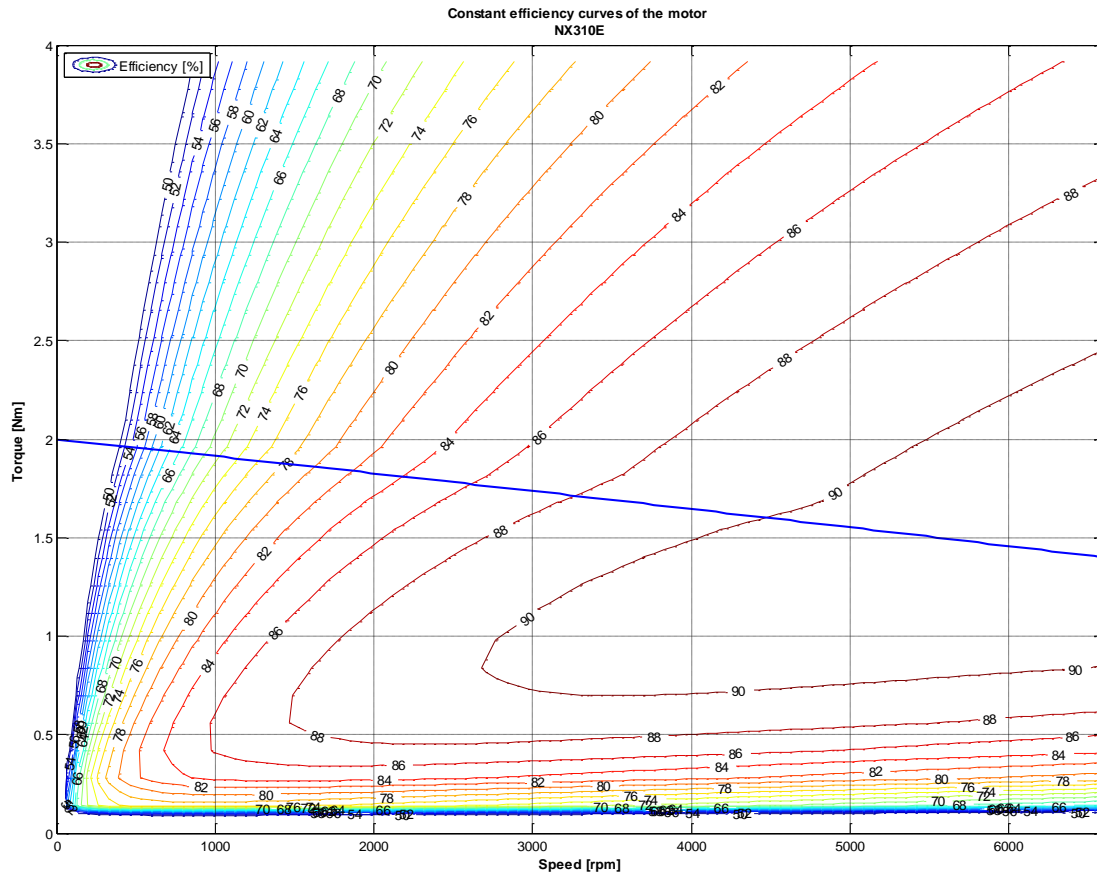

Caution: The efficiency curves are given for an optimal motor control (no voltage saturation and optimal phase between current and EMF)

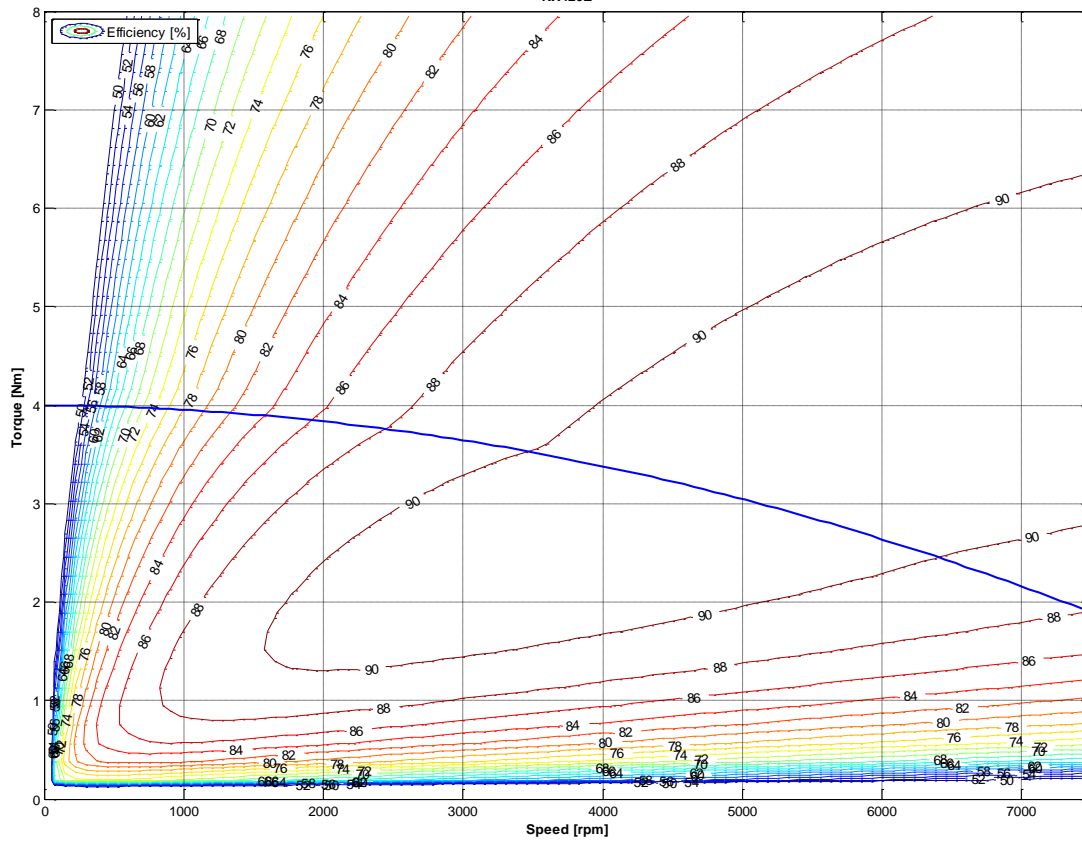

Caution: The efficiency curves do not include the losses due to the switching frequency.

3.2.4.1. Series NX310E

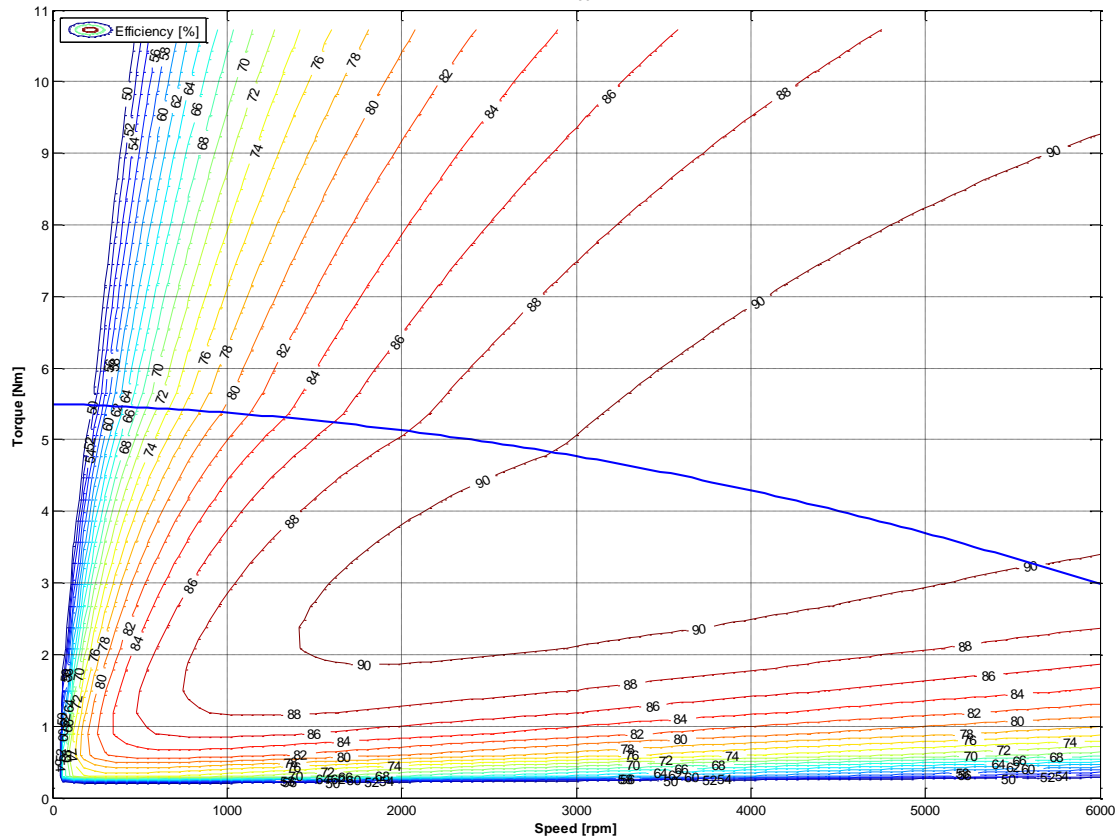

3.2.4.2. Series NX420E

Constant efficiency curves of the motor
NX420E

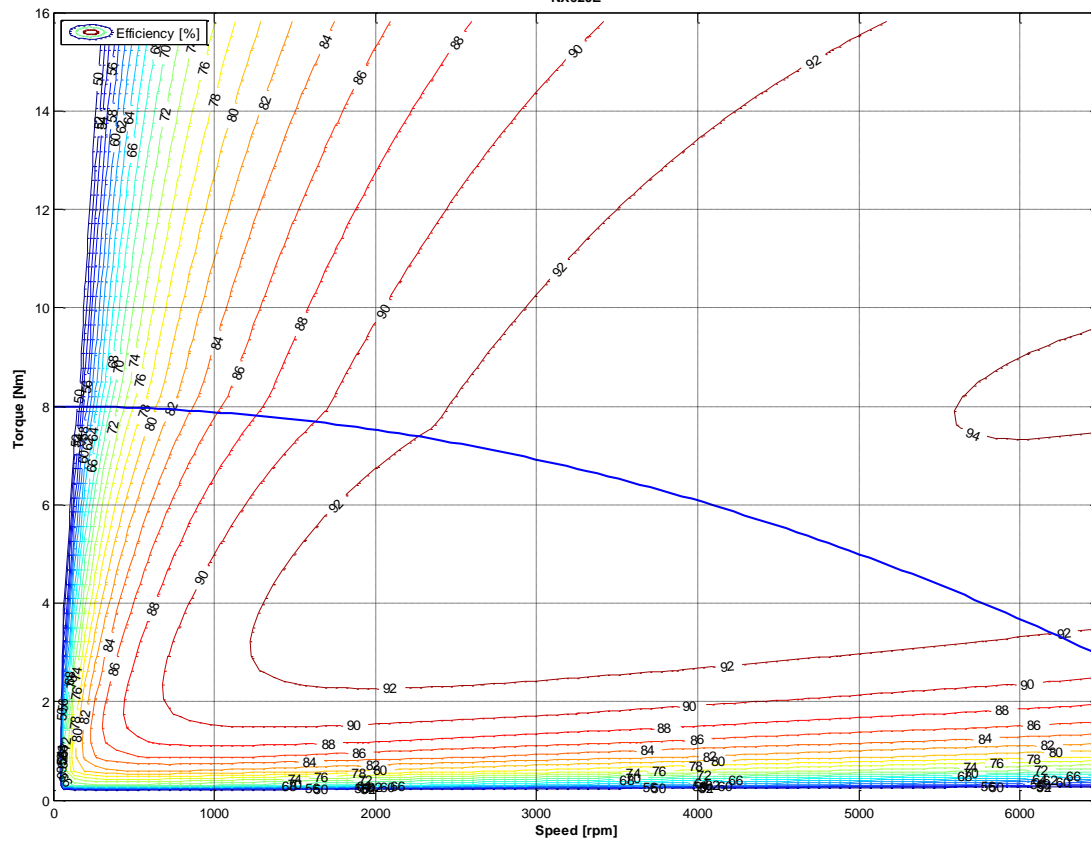

3.2.4.3. Series NX430E

Constant efficiency curves of the motor
NX430E

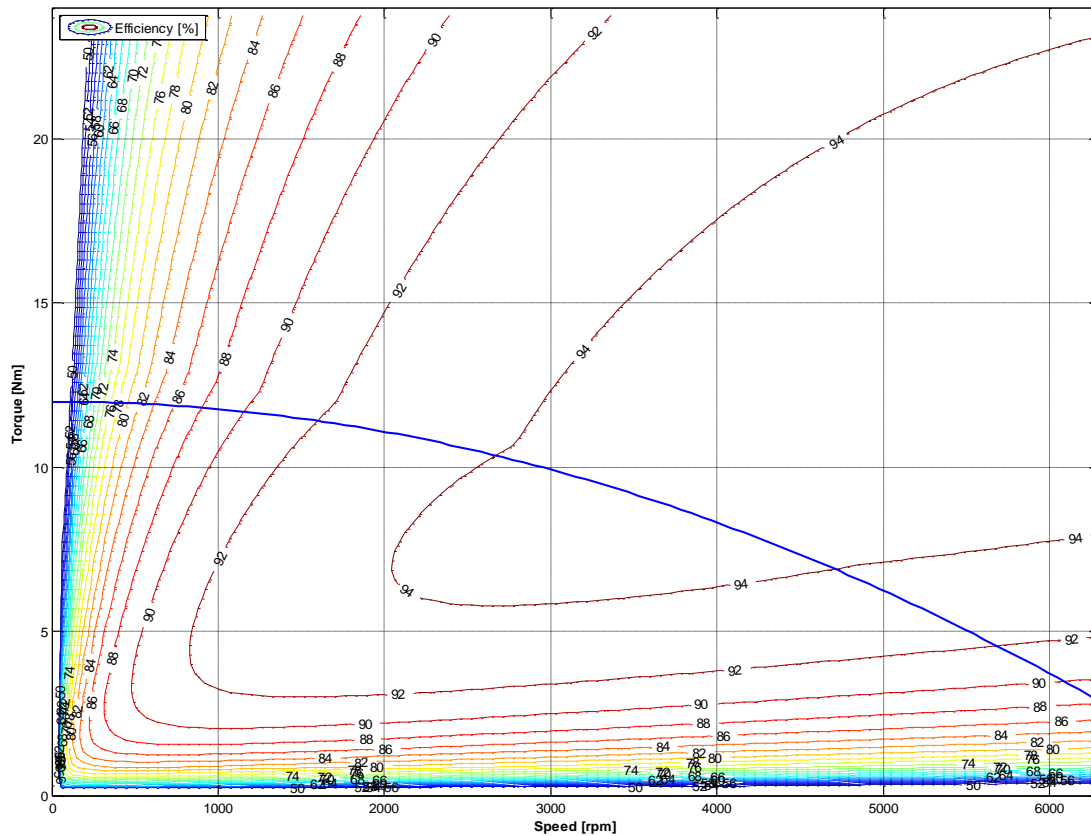

3.2.4.4. Series NX620E

Constant efficiency curves of the motor
NX620E

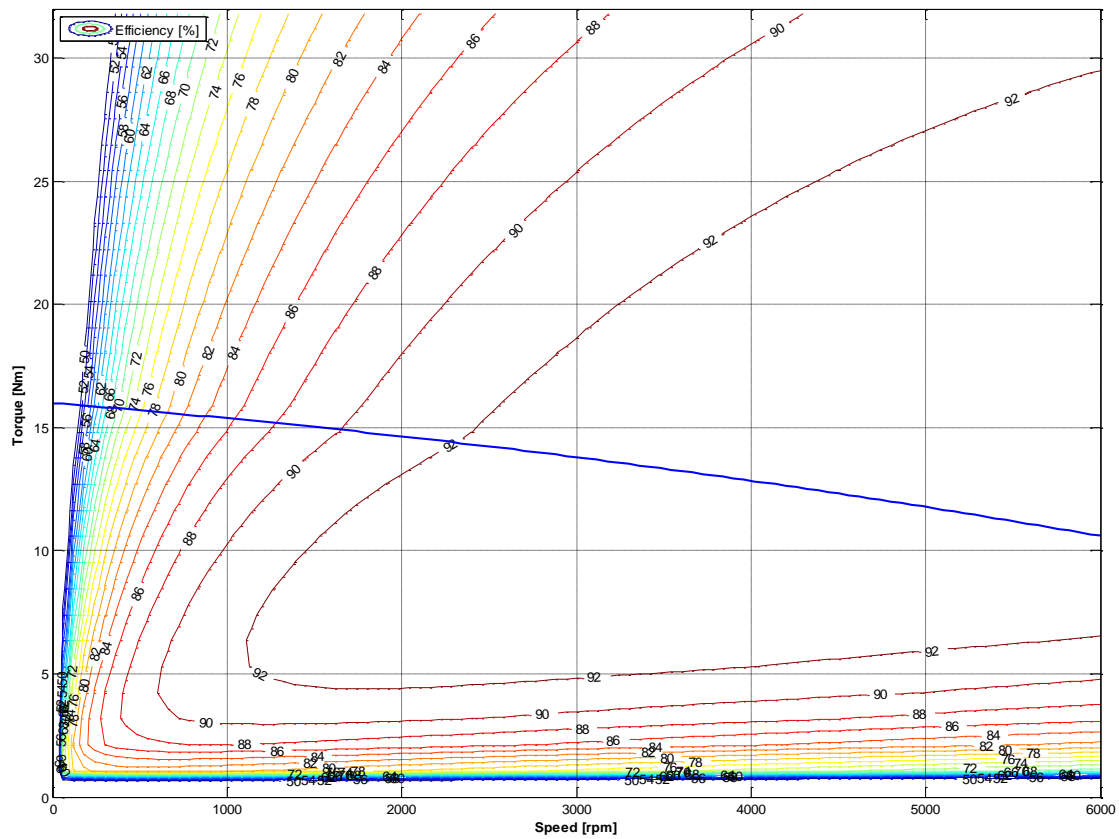

3.2.4.5. Series NX630E

Constant efficiency curves of the motor
NX630E

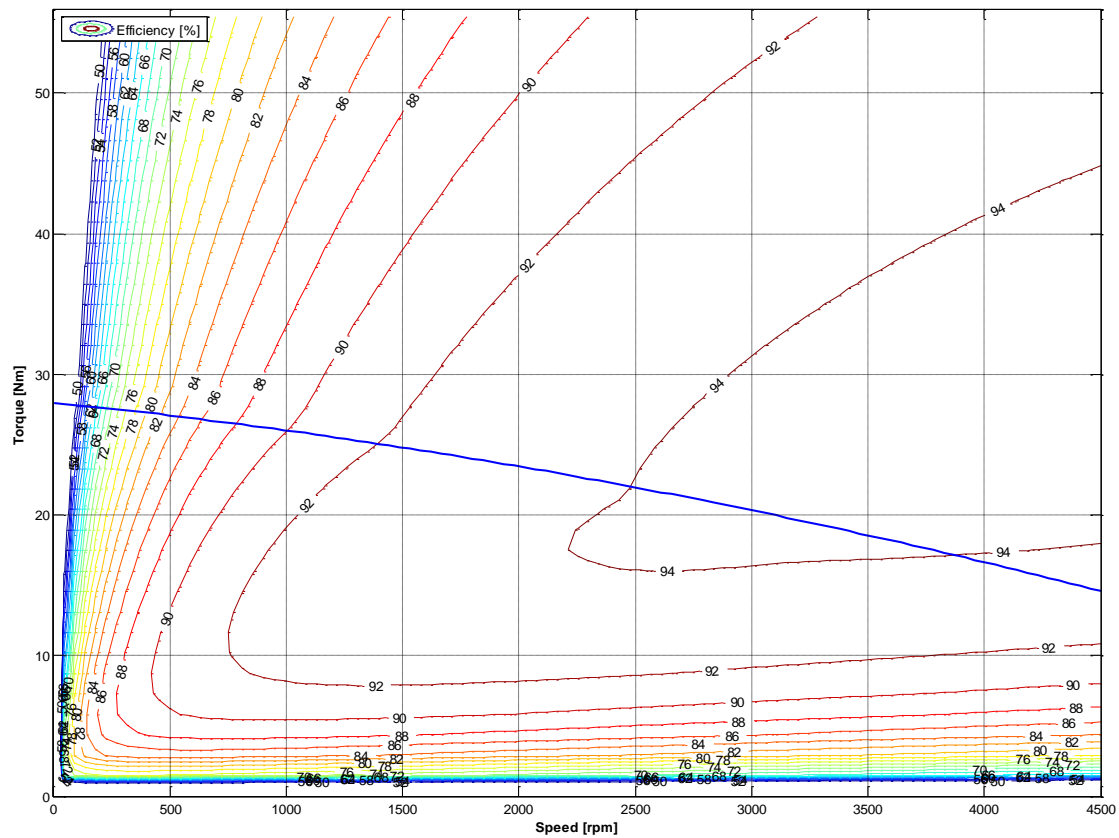

3.2.4.6. Series NX820E

Constant efficiency curves of the motor
NX820E

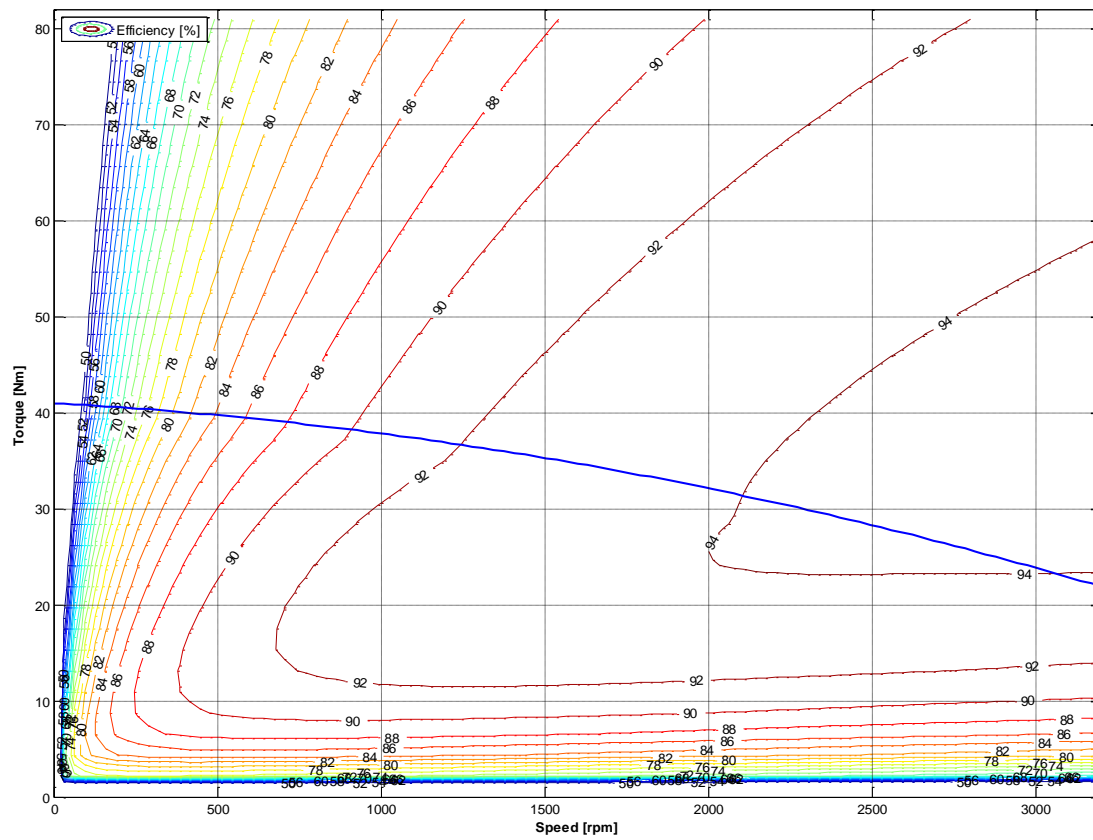

3.2.4.7. Series NX840E

Constant efficiency curves of the motor
NX840E

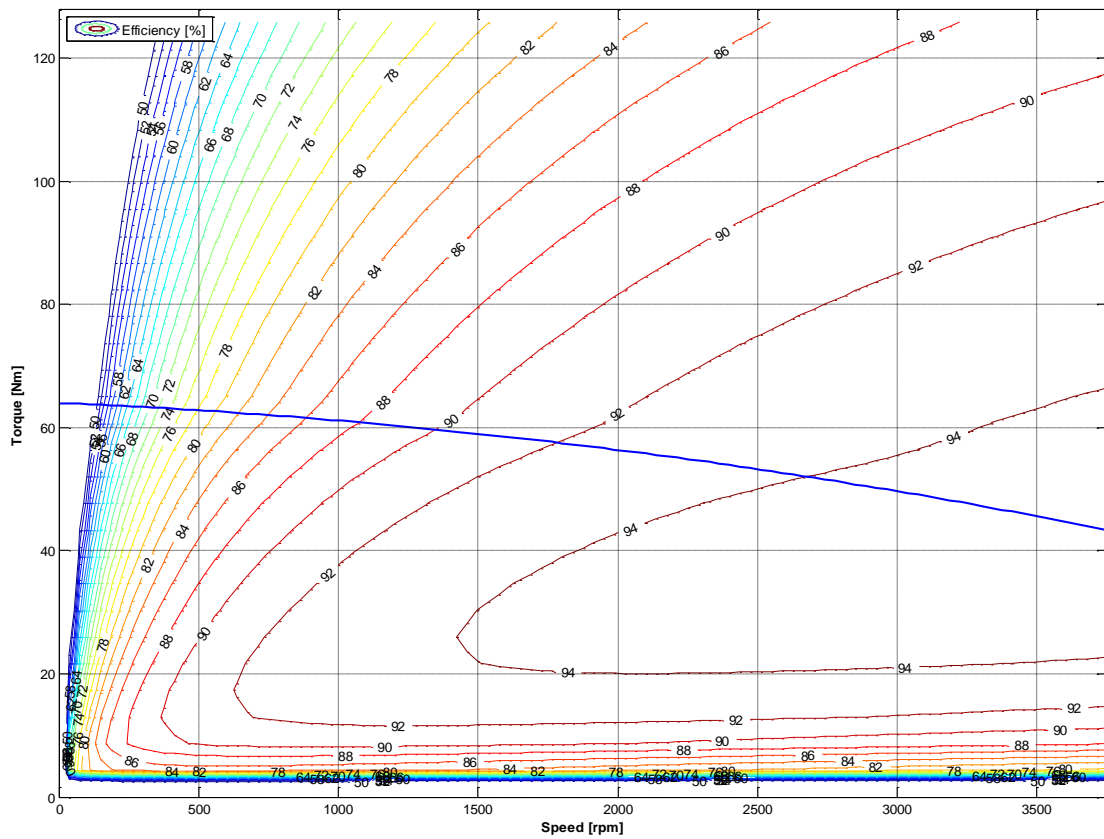

3.2.4.8. Series NX860E

Constant efficiency curves of the motor
NX860E

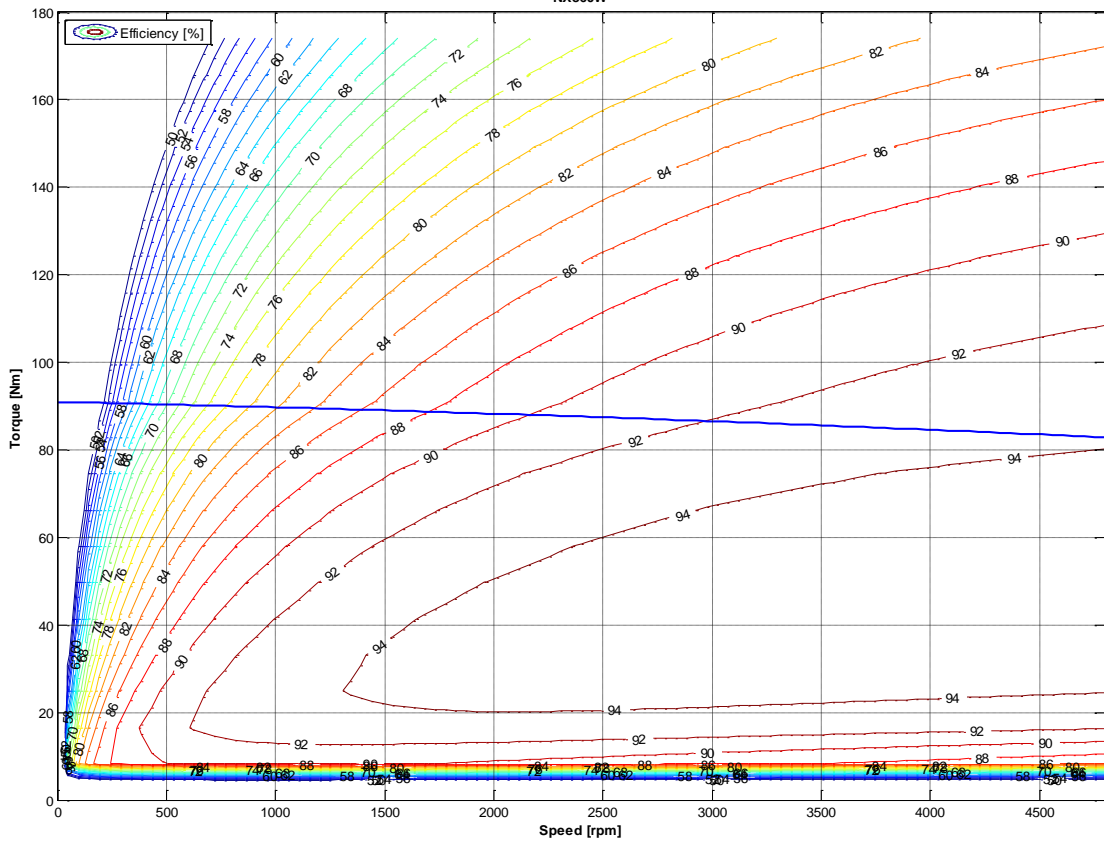

3.2.4.9. Series NX860V

Constant efficiency curves of the motor
NX860V

3.2.4.10. Series NX860W

Constant efficiency curves of the motor
NX860W

3.2.5. Electromagnetic losses

Caution: Following data result from our best estimations but are indicative. They can vary from one motor to another and with temperature. No responsibility will be accepted for direct or indirect losses or damages due to the use of these data.

(Following data are indicative)

Type	Tf [Nm]	Kd [Nm/1000rpm]
NX310EAP	0.067	0.033
NX420EAP	0.090	0.114
NX430EAP	0.106	0.149
NX620EAR	0.106	0.196
NX630EAR	0.131	0.245
NX820EAR	0.160	0.300
NX840EAK	0.190	0.380
NX860EAJ	0.220	0.460

Torque losses = Tf + Kd x speed/1000

3.2.6. Time constants of the motor

3.2.6.1. Electric time constant:

$$\tau_{elec} = \frac{L_{ph-ph}}{R_{ph-ph}}$$

With following values given in the motor data sheet

L_{ph-ph} inductance of the motor phase to phase [H],

R_{ph-ph} resistance of the motor phase to phase at 25°C [Ohm].

Example:

Motor series NX620EAR

$L_{ph-ph} = 19.2 \text{ mH}$ or $19.2 \cdot 10^{-3} \text{ H}$

R_{ph-ph} at 25°C = 2.24 Ohm

→ $\sigma_{elec} = 19.2 \cdot 10^{-3} / 2.24 = 8.6 \text{ ms}$

An overall summary of motor time constants is given a little further.

3.2.6.2. Mechanical time constant:

$$\tau_{mech} = \frac{R_{ph-ph} * J}{Kt * Ke_{ph-ph}} = \frac{0.5 * R_{ph-ph} * J}{(3 * \frac{Ke_{ph-ph}}{\sqrt{3}}) * \frac{Ke_{ph-ph}}{\sqrt{3}}}$$

$$\tau_{mech} = \frac{0.5 * R_{ph-ph} * J}{(Ke_{ph-ph})^2}$$

With following values obtained from the motor data sheet:

R_{ph-ph} resistance of the motor phase to phase at 25°C [Ohm],

J inertia of the rotor [kgm²],

Ke_{ph-ph} back emf coefficient phase to phase [V_{rms}/rad/s].

The coefficient Ke_{ph-ph} in the formula above is given in [V_{rms}/rad/s]

To calculate this coefficient from the datasheet, use the following relation:

$$Ke_{ph-ph} [V_{rms} / rad / s] = \frac{Ke_{ph-ph} [V_{rms} / 1000rpm]}{\frac{2 * \pi * 1000}{60}}$$

Example:

Motor series NX620EAR

R_{ph-ph} at 25°C = 2.24 Ohm

$J = 98 \cdot 10^{-5} \text{ kgm}^2$

$Ke_{ph-ph} [V_{rms} / 1000rpm] = 95.7 [V_{rms} / 1000rpm]$

→ $Ke_{ph-ph} [V_{rms} / rad/s] = 95.7 / (2 * \pi * 1000 / 60) = 0.9139 [V_{rms} / rad/s]$

→ $\sigma_{mech} = 0.5 * 2.24 * 98 \cdot 10^{-5} / (0.9139^2) = 1.2 \text{ ms}$

Remarks:

For a DC motor, the mechanical time constant σ_{mech} represents the duration needed to reach 63% of the final speed when applying a voltage step without any resistant torque. However this value makes sense only if the electric time constant σ_{elec} is much smaller than the mechanical time constant σ_{mech} (for the motor NX620EAR taken as illustration, it is not the case because we obtain $\sigma_{\text{mech}} < \sigma_{\text{elec}}$).

An overall summary of motor time constants is given a little further.

3.2.6.3. Thermal time constant of the copper:

$$\tau_{\text{therm}} = Rth_{\text{copper_iron}} * Cth_{\text{copper}}$$

$$Cth_{\text{copper}[\text{J}/^{\circ}\text{K}]} = Mass_{\text{copper}[\text{Kg}]} * 389_{[\text{J}/\text{kg}^{\circ}\text{K}]}$$

With:

$Rth_{\text{copper_iron}}$ thermal resistance between copper and iron [$^{\circ}\text{K}/\text{W}$]

Cth_{copper} thermal capacity of the copper [$\text{J}/^{\circ}\text{K}$]

$Mass_{\text{copper}}$ mass of the copper (winding) [kg]

Hereunder is given an overall summary of motor time constants:

Type	Electric time constant [ms]	Mechanical time constant [ms]	Thermal time constant of copper [s]
NX310E	3.0	1.1	60.2
NX420E	4.6	1.4	71.0
NX430E	5.2	1.1	79.8
NX620E	8.6	1.3	137
NX630E	10.3	1.0	158
NX820E	8.5	2.1	135
NX840E	11.0	1.5	171
NX860E	12.9	1.3	206
NX860V	12.9	1.3	81

3.2.7. Speed ripple

The typical speed ripple for a NX motor with a resolver at 4000rpm is 3% peak to peak. This value is given as indicative data because depending on the settings of the drive (gains of both speed and current regulation loops, presence of filtering or not, load inertia, resistant torque and type of sensor in use), without external load (neither external inertia nor resistant torque).

3.2.8. Cogging torque

The typical cogging for a NX series below is the maximum value peak to peak in N.cm:

Motor	Cogging Maxi [N.cm]
NX310	2.5
NX420	4.4
NX430	5.7
NX620	5.3
NX630	6.8
NX820	9
NX840	16
NX860	20

3.2.9. Rated data according to rated voltage variation

The nominal characteristics and especially the rated speed, maximal speed, rated power, rated torque, depend on the nominal voltage supplying the motor considered as the rated voltage. The rated data mentioned in the data sheet are given for each association of motor and drive. Therefore, if the supply voltage changes, the rated values will also change. As long as the variation of the rated voltage remains limited, for instance $\pm 10\%$ of the nominal value, it is possible to correctly evaluate the new rated values as illustrated below.

Example:

Extract of NX620EAR datasheet

BRUSHLESS MOTORS				
NX620EAR

Back emf constant at 1000 rpm (25°C)*	K_e	V_{rms}	95.7		
Torque sensitivity	K_t	Nm/A_{rms}	1.51		
Winding resistance (25°C)*	R_b	Ω	2.24		
Winding inductance*	L	mH	19.2		
Rotor inertia	J	$kgm^2 \times 10^{-5}$	98		
Thermal time constant	T_{th}	min	27		
Motor mass	M	kg	7		
Voltage of the mains	UR1 UR2 UR3	V_{rms}	230	400	480
Rated speed	Nn1 Nn2 Nn3	rpm	2200	3900	4500
Rated torque	Mn1 Mn2 Mn3	Nm	7.42	6.17	5.57
Rated current	In1 In2 In3	A_{rms}	4.99	4.25	3.89
Rated power	Pn1 Pn2 Pn3	W	1710	2520	2620

□ If we suppose that the rated voltage $U_n=400 V_{rms}$ decreases of **10%** ; this means that the new rated voltage becomes $U_{n2}=360 V_{rms}$.

Rated speed:

The former rated speed $N_n=3900$ rpm obtained with a rated voltage $U_n=400 V_{rms}$ and an efficiency of $\eta=92\%$ leads to the new rated speed N_{n2} given as follows:

$$N_{n2} = N_n * \frac{\frac{U_{n2}}{U_n} - 1 + \eta}{\eta}$$

$$N_{n2} = 3900 * \frac{\frac{360}{400} - 1 + 0.92}{0.92} = 3476rpm$$

Maximum speed:

The former maximum speed $N_{\max} = 3900$ rpm obtained with $U_n = 400$ V_{rms} and $N_n = 3900$ rpm leads to the new maximum speed $N_{\max 2}$ given as follows:

$$N_{\max 2} = N_{\max} * \frac{N_{n2}}{N_n} \qquad N_{\max 2} = 3900 * \frac{3476}{3900} = 3476 \text{ rpm}$$

N.B.

□ If the rated voltage increases ($U_{n2} > U_n$), the new rated speed N_{n2} and the new maximum speed $N_{\max 2}$ will be greater than the former ones N_n and N_{\max} . Moreover you will have to check that the drive still shows able to deal with the new maximum electric frequency.

	<p><u>Warning:</u> If the main supply decreases, you must reduce the maximum speed accordingly in order not damage the motor. In case of doubt, consult us.</p>
---	---

Rated power:

The former rated power $P_n = 2520$ W obtained with $U_n = 400$ V_{rms} leads to the new rated power P_{n2} given as follows:

$$P_{n2} = P_n * \frac{U_{n2}}{U_n} \qquad P_{n2} = 2520 * \frac{360}{400} = 2268 \text{ W}$$

Rated torque:

The former rated torque $M_n = 6.17$ Nm obtained with $U_n = 400$ V_{rms} leads to the new rated torque M_{n2} given as follows:

$$M_{n2} = \frac{P_{n2}}{\frac{2 * \pi * N_{n2}}{60}} \qquad M_{n2} = \frac{2268}{\frac{2 * \pi * 3476}{60}} = 6.23 \text{ Nm}$$

3.2.10. Voltage withstand characteristics of NX series

The motors fed by converters are subject to higher stresses than in case of sinusoidal power supply. The combination of fast switching inverters with cables will cause overvoltage due to the transmission line effects. The peak voltage is determined by the voltage supply, the length of the cables and the voltage rise time. As an example, with a rise time of 200 ns and a 30 m (100 ft) cable, the voltage at the motor terminals is twice the inverter voltage.

The insulation system of the servomotors NX is designed to withstand high repetitive pulse voltages and largely exceeds the recommendations of the IEC/TS 60034-25 ed 2.0 2007-03-12 for motors without filters up to 500V AC (See figure 1).

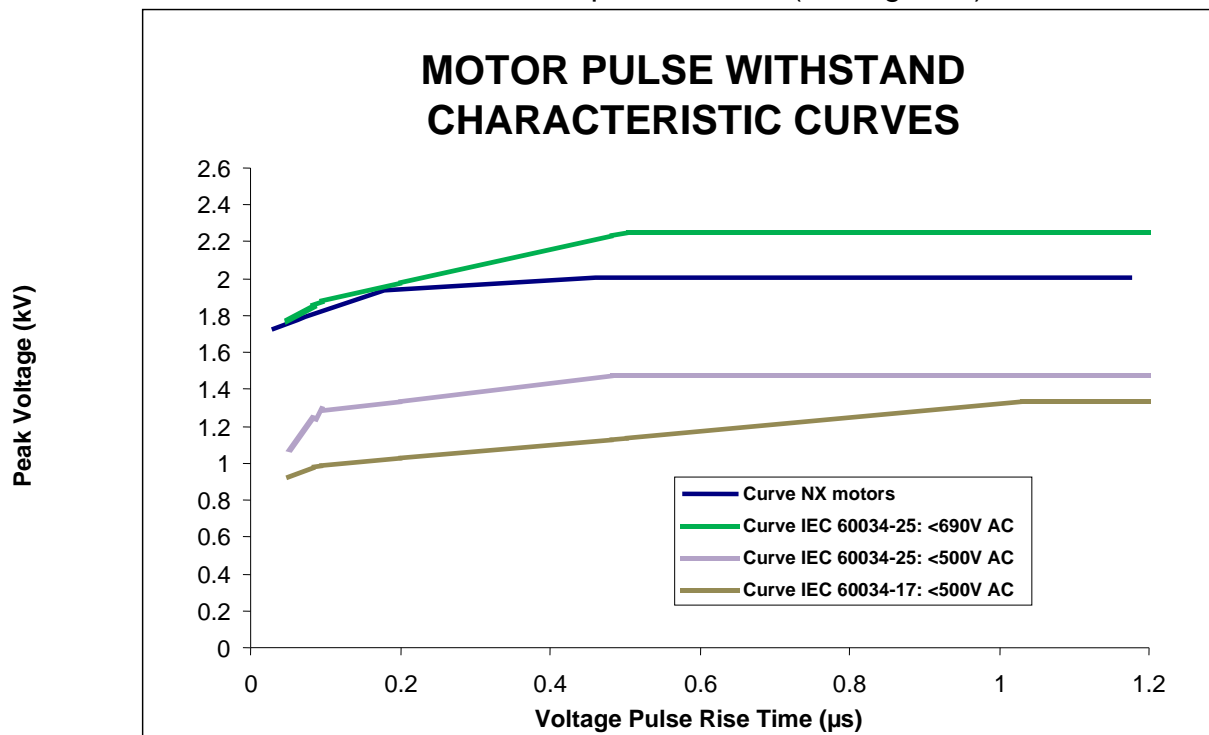

Figure 1: Minimum Voltage withstands characteristics for motors insulations according to IEC standards. At the top are the typical capabilities for the NX motors.

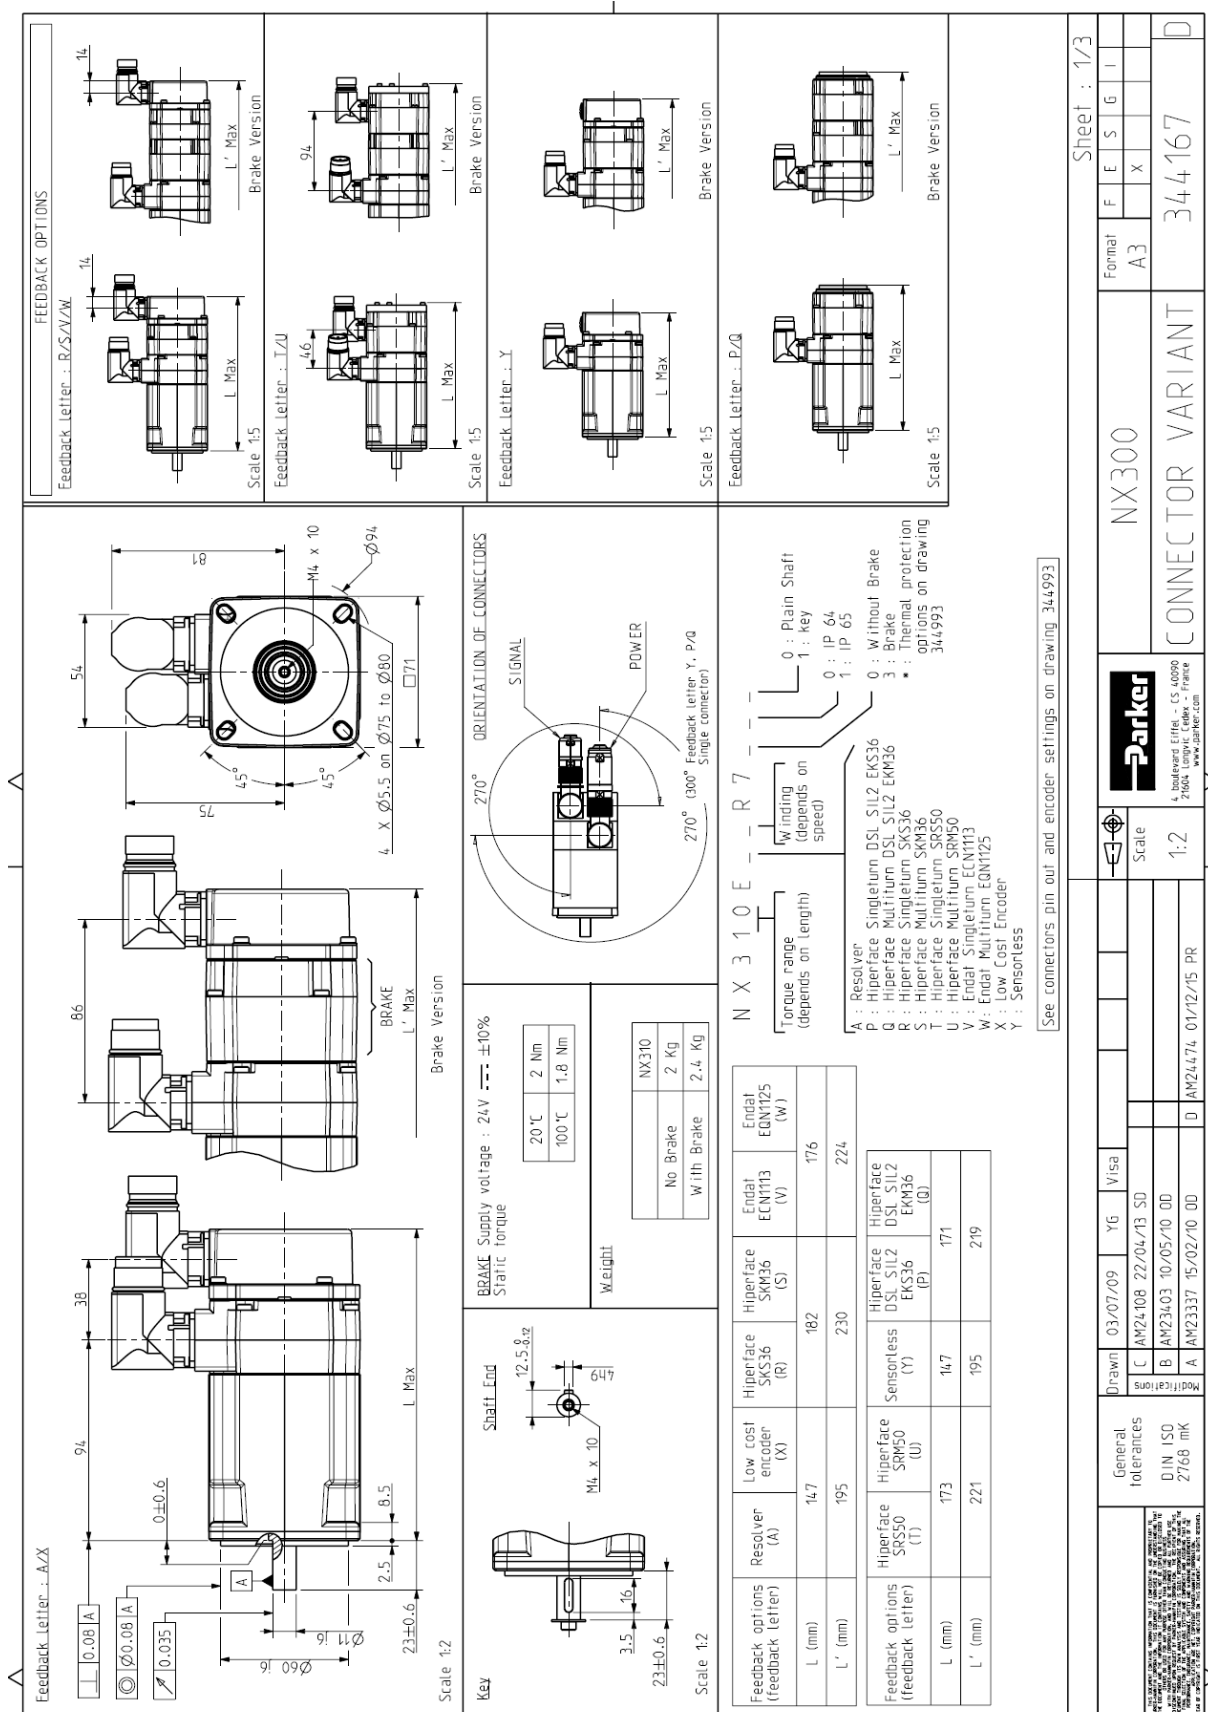

Note: The pulse rise times are defined in accordance with the IEC/TS 60034-17 ed4.0 2006-05-09.

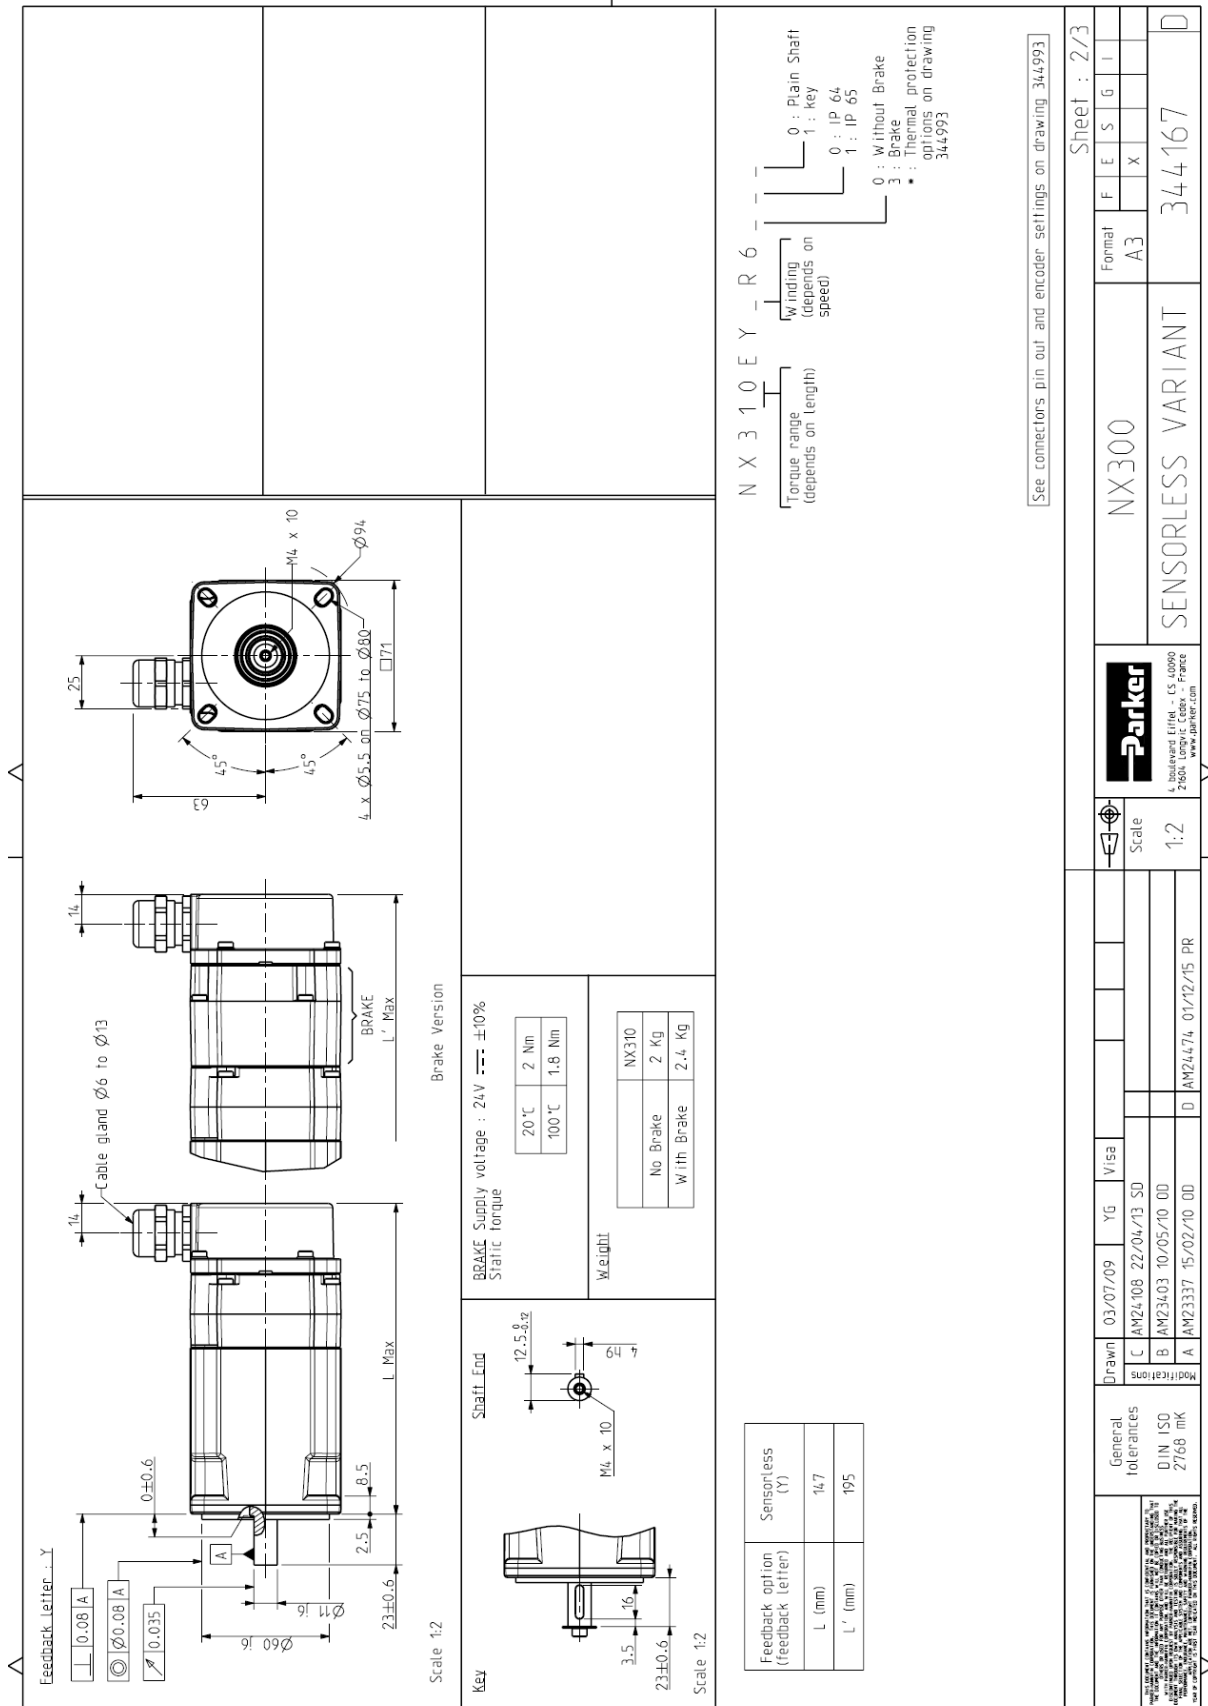

The NX motors can be used with a supply voltage up to 500 V under the following conditions:

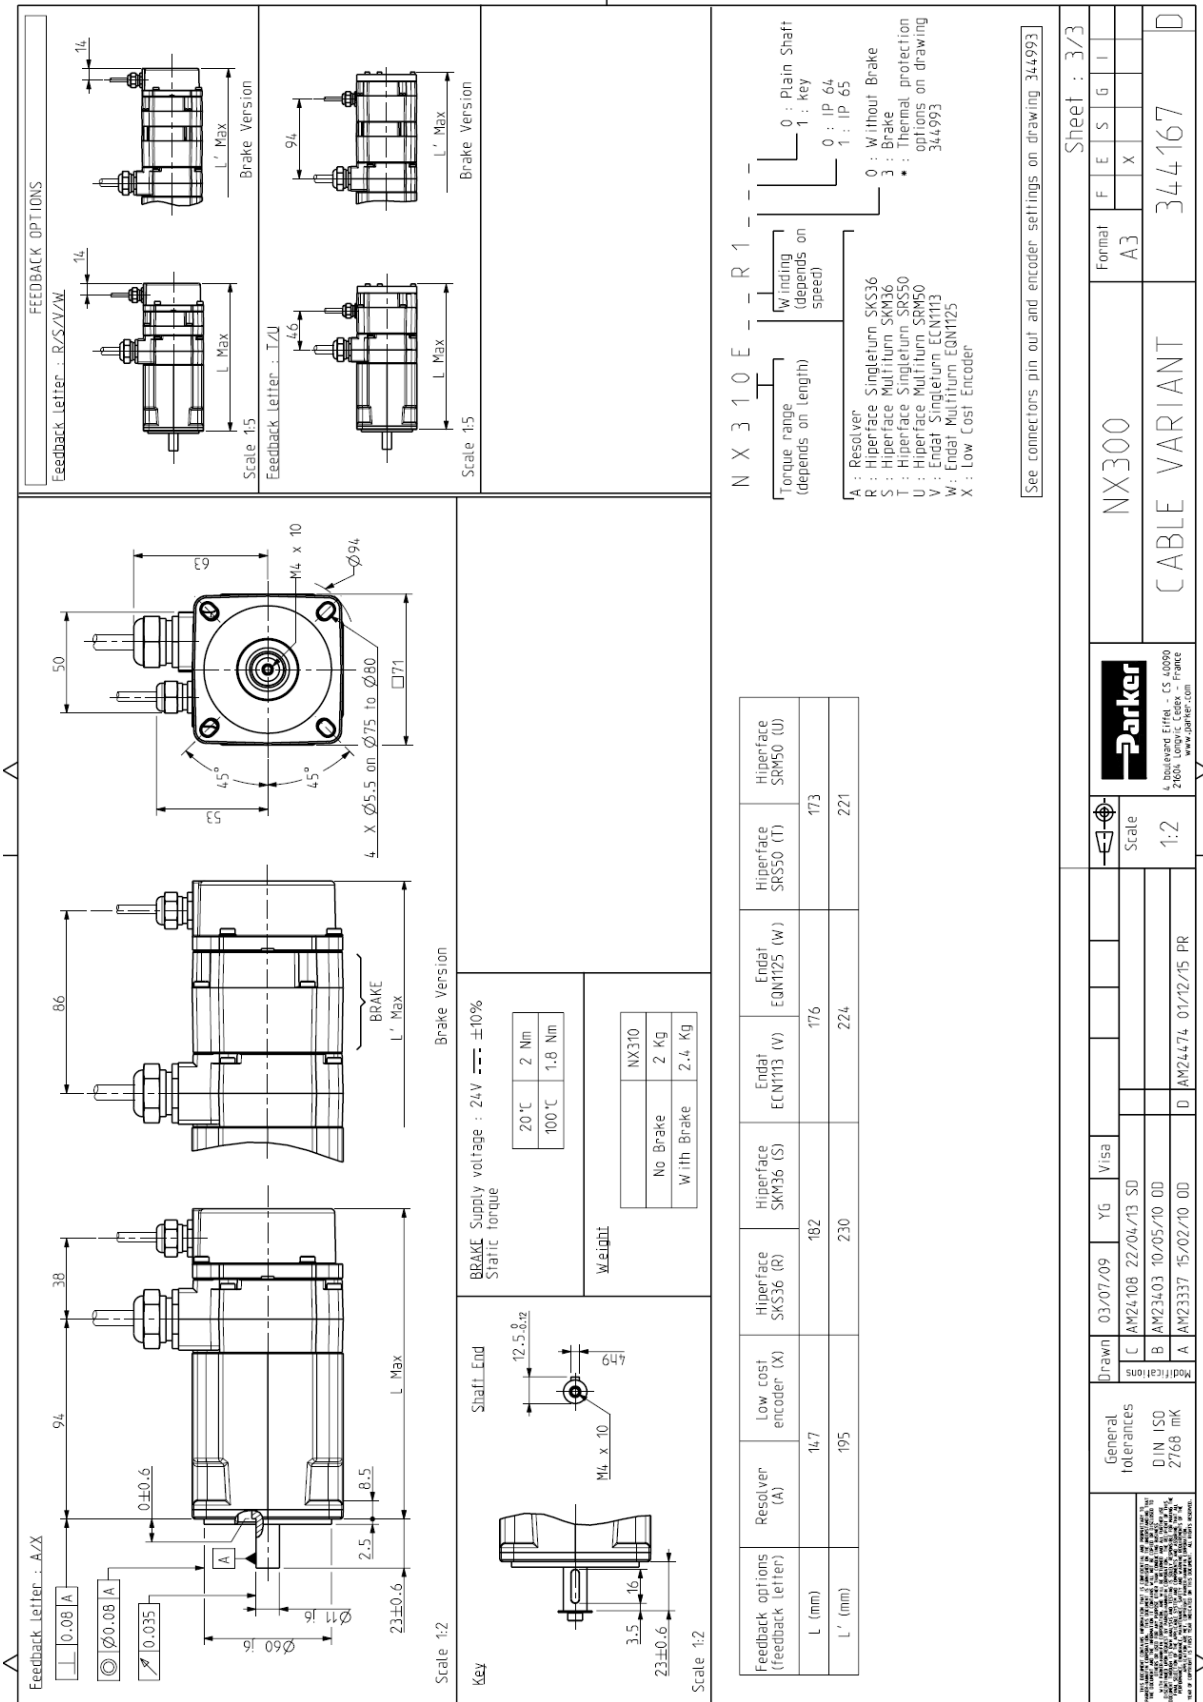

- The pulse rise times must be longer than 50 ns.
- The repetitive pulse voltages must not exceed the values given in figure 1, “Curve NX motors” in dark blue.

OUTLINE DRAWING

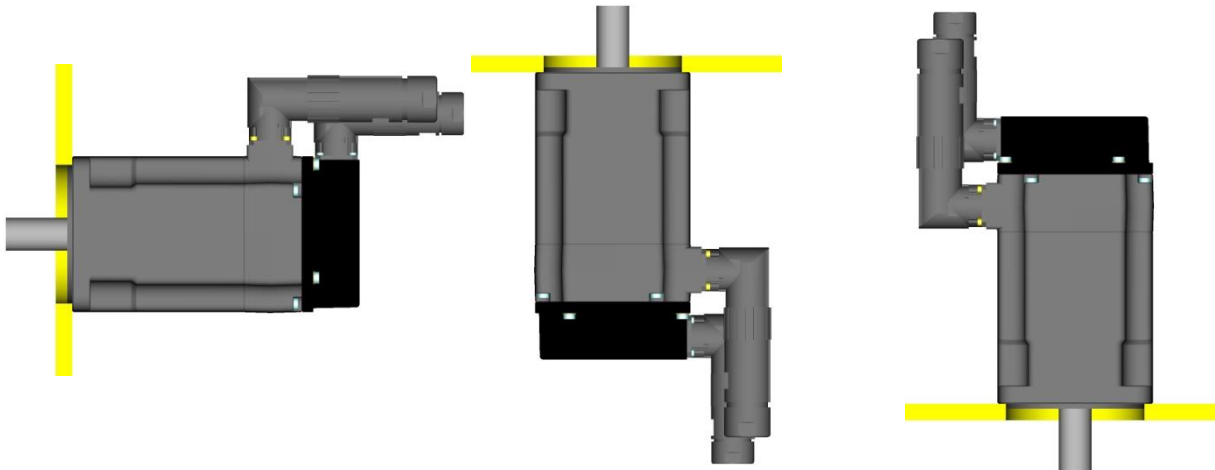

Format A3

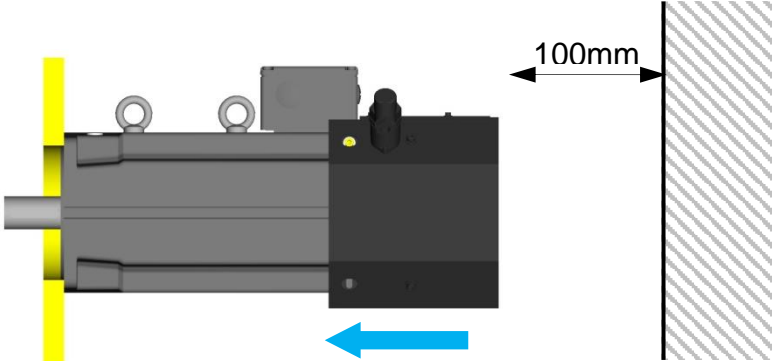

345070AE6000 -

3.4. Motor Mounting

3.4.1. Motor mounting

By flange in any direction

	<p>Warning : For NX8 with fan cooling, the air inlet of the fan has to be at 100mm mini from a wall.</p>  <p>100mm</p> <p>Air flow direction</p>
---	---

3.4.2. Frame recommendation

	<p><u>Warning</u> : The user has the entire responsibility to design and prepare the support, the coupling device, shaft line alignment, and shaft line balancing.</p>
---	--

Foundation must be even, sufficiently rigid and shall be dimensioned in order to avoid vibrations due to resonances.

The servomotors need a rigid support, machined and of good quality.

The maximum flatness of the support has to be lower than 0.05mm.

The motor vibration magnitudes in rms value are in accordance with IEC 60034-14 – grade A:

- maximum rms vibration velocity for NX is 1.3mm/s for rigid mounting

	<p><u>Warning</u> : A grade A motor (according to IEC 60034-14) well-balanced, may exhibit large vibrations when installed in-situ arising from various causes, such as unsuitable foundations, reaction of the driven motor, current ripple from the power supply, etc. Vibration may also be caused by driving elements with a natural oscillation frequency very close to the excitation due to the small residual unbalance of the rotating masses of the motor. In such cases, checks should be carried out not only on the machine, but also on each element of the installation. (See ISO 10816-3).</p>
--	--

	<p><u>Warning</u> : A bad setting of the electronic control of the close loop (gain too high, incorrect filtering ...) can occur an instability of the shaft line, vibration or/and breakdown - . Please consult us</p>
---	---

3.5. Shaft Loads

3.5.1. Vibration resistance to shaft end

Frequency domain : 10 to 55 Hz according to EN 60068 -2-6

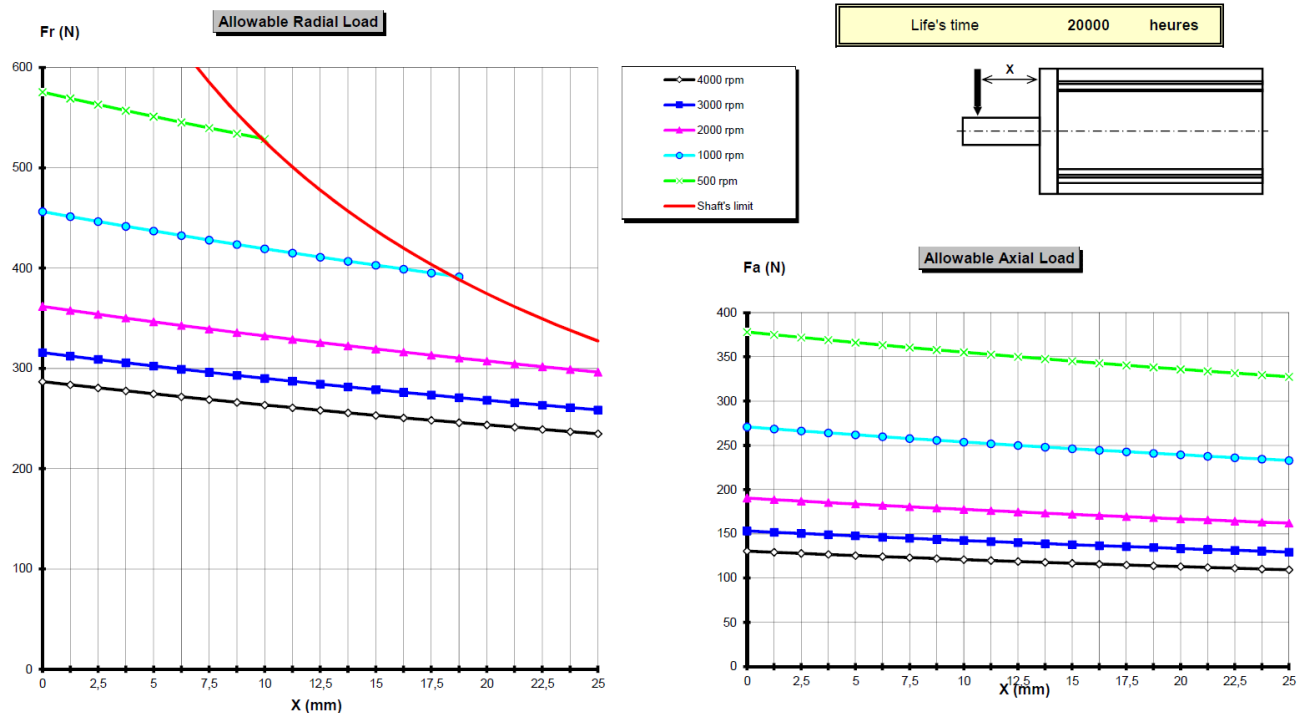

Vibration resistance to the shaft end :

- radial 3 g
- axial 1 g

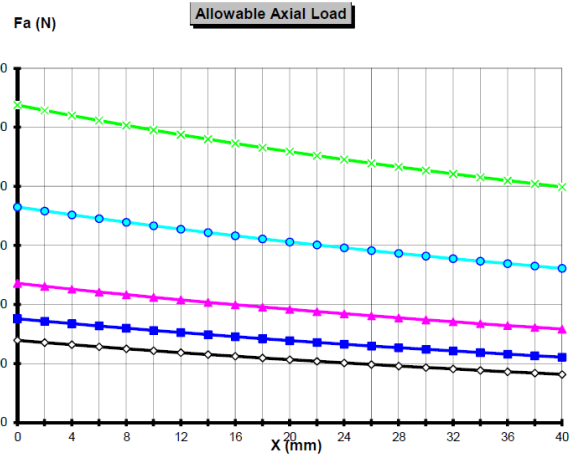

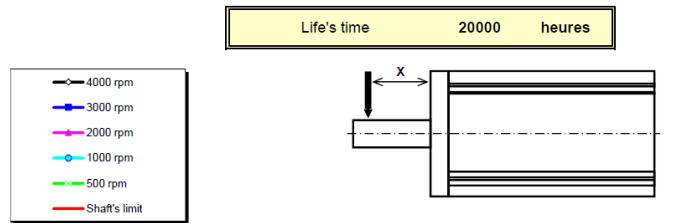

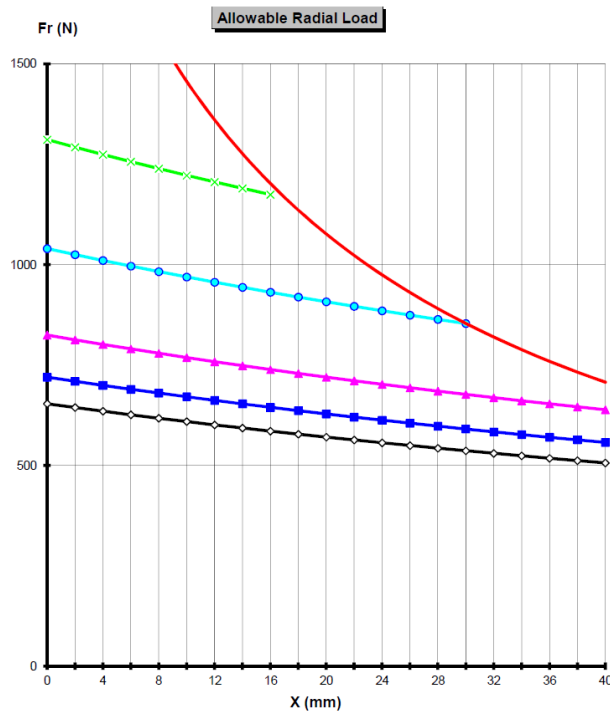

3.5.2. Motors life time for horizontal mounting

	<p>The bearing arrangement is made with 2 ball bearings (one on the shaft end + another on the rear). The rear bearing is blocked in axial translation and the front one is free in translation to avoid any stress from the shaft thermal expansion during the running. So, it is important not to block in translation the shaft expansion by any extra bearing or similar device.</p>
	<p><u>Notice:</u> Curves below are valid only for horizontal mounting and a life time L10 of 20 000h at constant speed in accordance with ISO281.</p> <p><u>Notice:</u> Radial and Axial Loads are not additive</p>

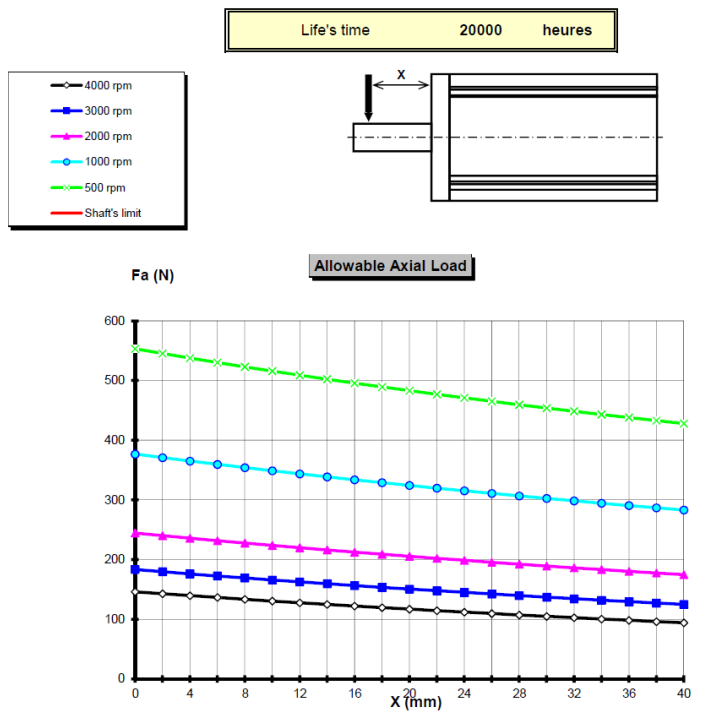

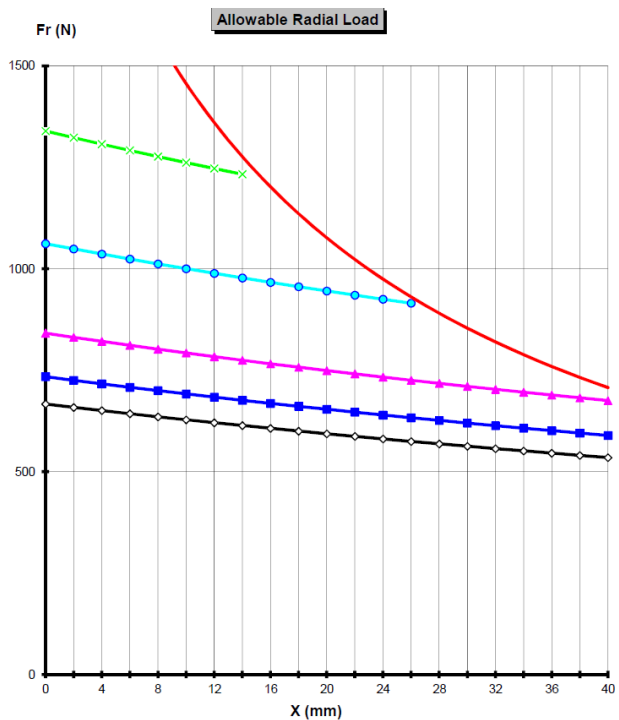

3.5.2.1. NX310

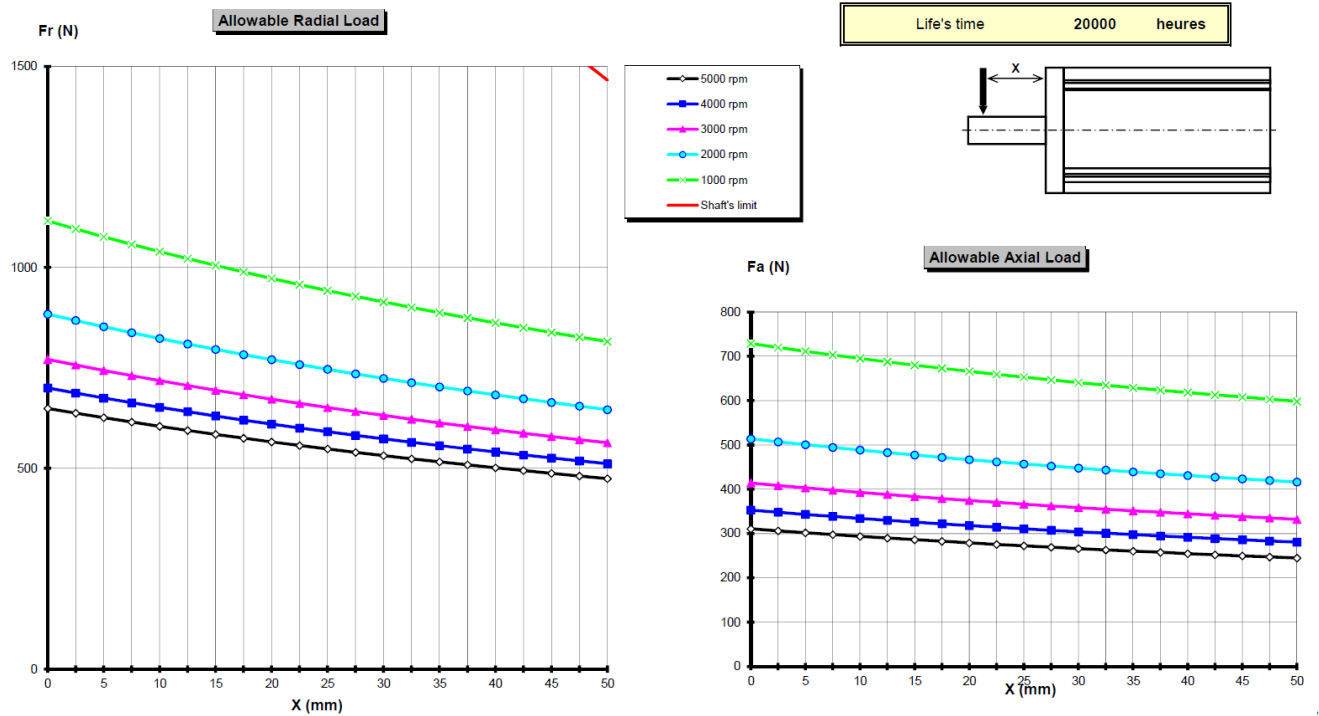

3.5.2.2. NX420

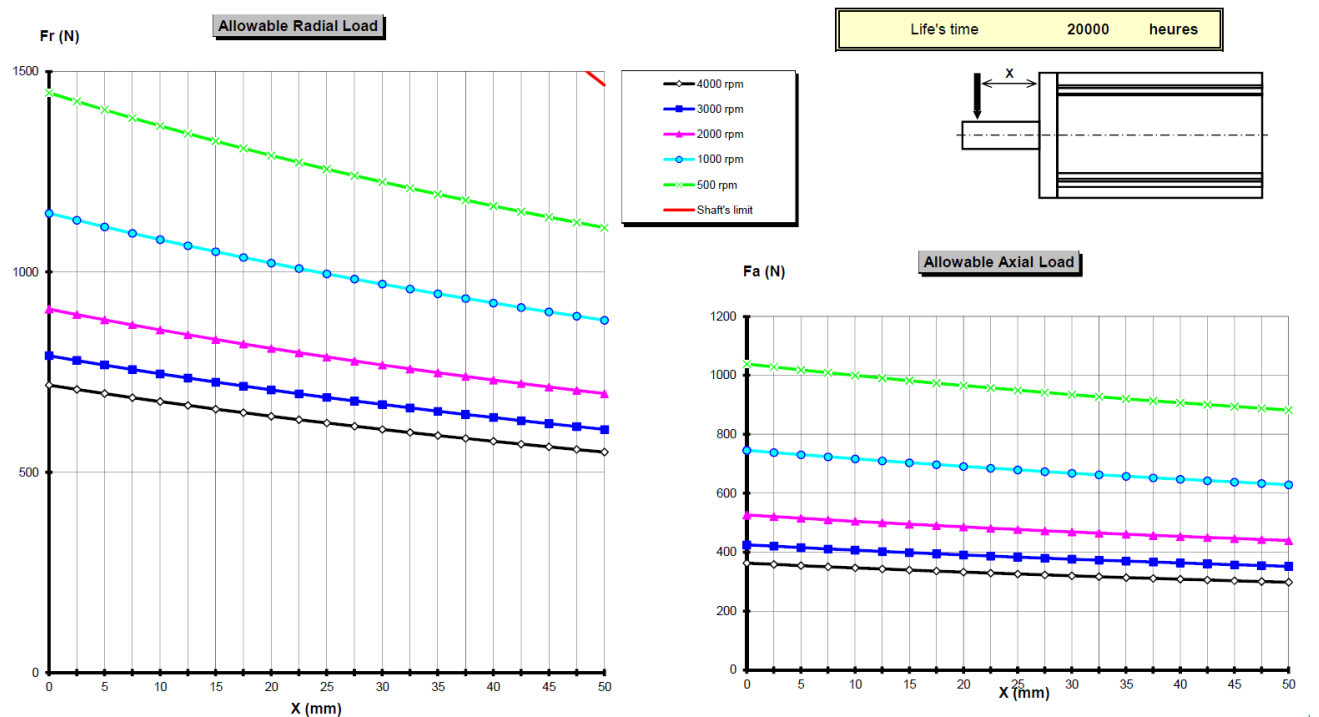

3.5.2.3. NX430

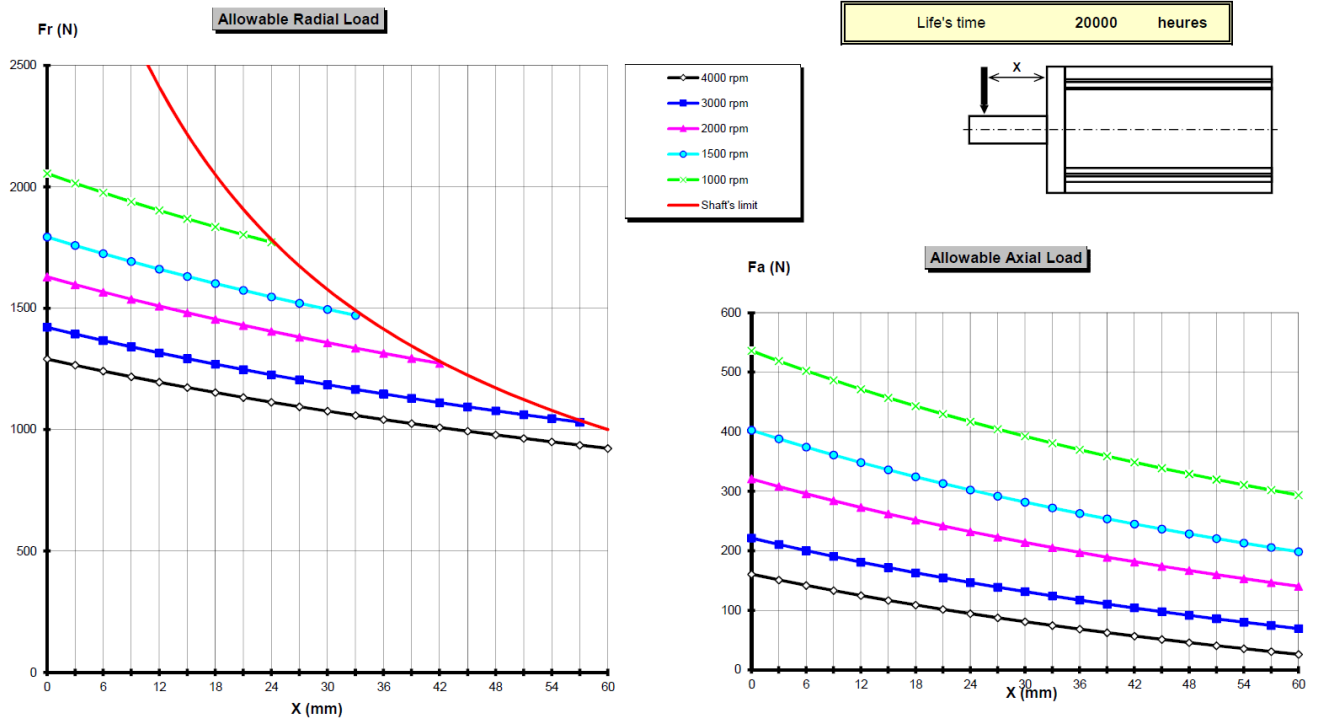

3.5.2.4. NX620

3.5.2.6. NX820

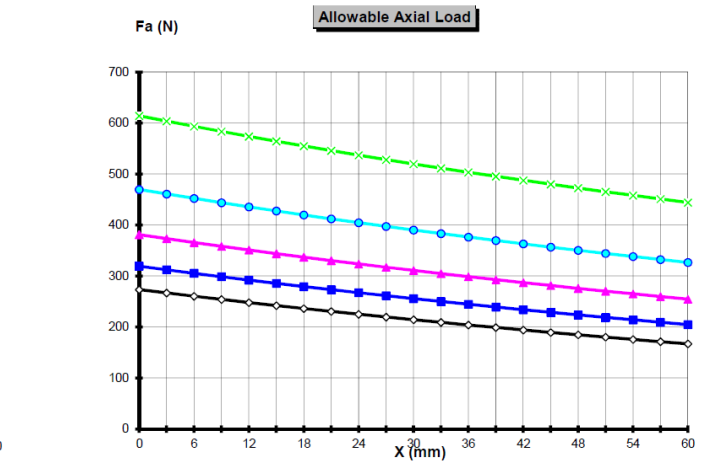

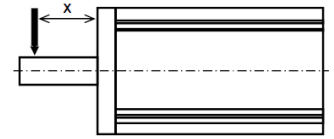

3.5.2.7. NX840

3.5.2.8. NX860

Life's time 20000 heures

3.6. Cooling

In compliance with the IEC 60034-1 standards:

3.6.1. Natural and fan cooled motor

The ambient air temperature shall not be less than **-15°C** and more than **40°C**.

	It is possible to use the motors in an higher ambient temperature but with an associated derating to the motor performances.
	<u>Warning:</u> To reach the motor performances calculated, the motor must be thermally well connected to a aluminium flange with a dimension of 400 mm x 400 mm and with a thickness of 12 mm.
	<u>Caution:</u> the ambient air temperature shall not exceed 40°C in the vicinity of the motor flange
	<u>Warning:</u> A significant part of the heat produced by the motor is evacuated through the flange. <ul style="list-style-type: none">• if the air is not able to circulate freely around the motor,• if the motor is mounted on a surface that dissipates not well the heating (surface with little dimensions for instance),• if the motor is thermally isolated,• if the motor is mounted on a warm surface (mounted on a gearbox for instance), then the motor has to be used at a torque less than the rated torque.

3.6.3. Water cooled motor

	<p><u>Danger:</u> The cooling system has to be operational when the motor is running or energized.</p>
	<p><u>Danger:</u> The Inlet temperature and the water flow have to be monitored to avoid any exceeding values.</p>
	<p><u>Caution:</u> When motor is not running, the cooling system has to be stopped 10 minutes after motor shut down.</p>
	<p><u>Caution:</u> Condensation and risk of rust may occur when the temperature gradient between the air and the water becomes significant. Condensation is also linked to hygrometry rate. To avoid any issue, we recommend: $T_{\text{water}} > T_{\text{air}} - 2^{\circ}\text{C}$. The motor can be used with an ambient temperature between 27°C to 40°C with a high water temperature but with derating. If inlet water temperature becomes higher than 25°C, derating factor must be applied according to §3.1.2 Temperature Derating</p>
	<p><u>Caution:</u> the ambient air temperature shall not exceed 40°C in the vicinity of the motor flange</p>
	<p><u>Danger:</u> If the water flow stops, the motor can be damaged or destroyed causing accidents.</p>

3.6.4. Additives for water as cooling media

Please refer to motor technical data for coolant flow rates.

The water inlet temperature must not exceed **25°C** without torque derating.

The water inlet temperature must not be below **5°C**.

The inner pressure of the cooling liquid must not exceed **5 bars**.

Caution: To avoid the appearance of corrosion of the motor cooling system, the water must have anti-corrosion additive.

The servomotors are water cooled. Corrosion inhibitors must be added to the water to avoid the corrosion. The complete cooling system must be taken into account to choose the right additive, this includes: the different materials in the cooling circuit, the chiller manufacturer recommendations, the quality of the water...

The right additive solution is under the responsibility of the user. Some additives like TYFOCOR or GLYSANTIN G48 correctly used have demonstrated their ability to prevent corrosion in a closed cooling circuit.

For example: Glycantin G48 recommendations are :

- Water hardness: 0 to 20°dH (0 – 3.6 mmol/l)
- Chloride content: max. 100ppm
- Sulphate content: max. 100ppm

Caution: The water quality is very important and must comply with supplier recommendations. The additive quantity and periodic replacement must respect the same supplier recommendations.

Caution: The additive choice must take into account the global cooling system (chiller or water exchanger recommendations...).

Select carefully the materials of all the cooling system parts (chiller, exchanger, hoses, adapters and fittings) because the difference between material galvanic potential can make corrosion.

3.6.5. Motor cooling circuit drop pressure

The tab below describes the drop pressure at the water flow rate from the motor data:

Motor type	Drop pressure @ nominal water flow
NX860W	0.3 bar @ 5 l/min

Note : all motors drop pressure are checked before shipping.

3.6.6. Chiller selection

This section describes how to choose the chiller. The chiller is able to evacuate the heat from the motor losses with the water circulation.

The motor losses (= power to evacuate by the chiller) depend on the efficiency and motor power:

$$P_c = \left(\frac{1}{\rho} - 1 \right) \cdot P_n$$

With P_c : Power to evacuate by the chiller (kW)
 P_n : Nominal motor power (kW)
 ρ : motor efficiency at nominal power (%)

Refer to the respective motor data sheet for nominal power, efficiency and water flow. Chiller pump must provide water flow through motor and pipe pressure drop. Inlet temperature must be inferior to **25°C**.

Example

Motor : NX860W

For a torque of 80 N.m @ 2500 rpm, the efficiency is 92%.

Water flow = 5 l/min

$$P_n = 80 \times 2500 \times \pi / 30$$

$$P_n = 20.9 \text{ kW}$$

$$P_c = \left(\frac{1}{0.92} - 1 \right) \cdot 20.9 = \mathbf{1.8 \text{ kW}}$$

So, the chiller must evacuate 1.8 kW and has a water flow of 5 l/min for this point of running.

3.6.7. Flow derating according to glycol concentration

	Glycol concentration [%]					
	0	10	20	30	40	50
5	5.1	5.3	5.6	5.9	6.2	
10	10.2	10.6	11.1	11.8	12.4	
15	15.3	15.9	16.7	17.6	18.7	
20	20.4	21.2	22.2	23.5	24.9	
25	25.5	26.5	27.8	29.4	31.1	
30	30.6	31.8	33.4	35.3	37.3	
35	35.7	37.1	38.9	41.1	43.6	
40	40.8	42.4	44.5	47.0	49.8	
45	45.9	47.7	50.0	52.9	56.0	
50	51.0	53.0	55.6	58.8	62.2	
55	56.1	58.3	61.2	64.7	68.4	
60	61.2	63.5	66.7	70.5	74.7	
65	66.4	68.8	72.3	76.4	80.9	
70	71.5	74.1	77.8	82.3	87.1	
75	76.6	79.4	83.4	88.2	93.3	
80	81.7	84.7	89.0	94.1	99.5	
85	86.8	90.0	94.5	99.9	105.8	
90	91.9	95.3	100.1	105.8	112.0	
95	97.0	100.6	105.6	111.7	118.2	
100	102.1	105.9	111.2	117.6	124.4	
110	112.3	116.5	122.3	129.3	136.9	
120	122.5	127.1	133.4	141.1	149.3	
130	132.7	137.7	144.6	152.8	161.8	
140	142.9	148.3	155.7	164.6	174.2	
150	153.1	158.9	166.8	176.3	186.6	
160	163.3	169.5	177.9	188.1	199.1	
170	173.5	180.1	189.0	199.9	211.5	
180	183.7	190.6	200.2	211.6	224.0	
190	194.0	201.2	211.3	223.4	236.4	
200	204.2	211.8	222.4	235.1	248.9	

Use of the table above - Example

If the motor needs **25 l/min** with **0%** glycol,

If application needs **20%** glycol, the water flow must be **26.5 l/min**,

If application needs **40%** glycol, the water flow must be **29.4 l/min**.

Main formulas

$$Flow_rate = \frac{Power_dissipation * 60}{\Delta\theta^{\circ} * C_p}$$

With: *Flow rate* [l/min]
Power_dissipation [W]
 $\Delta\theta^{\circ}$ Gradient inlet-outlet [°C]
C_p thermal specific capacity of the water as coolant [J/kg°K]
(**C_p** depends on the % glycol concentration please see below)

Thermal specific capacity **C_p** according to % glycol concentration and temperature

We have considered an average temperature of the coolant of 30°C.

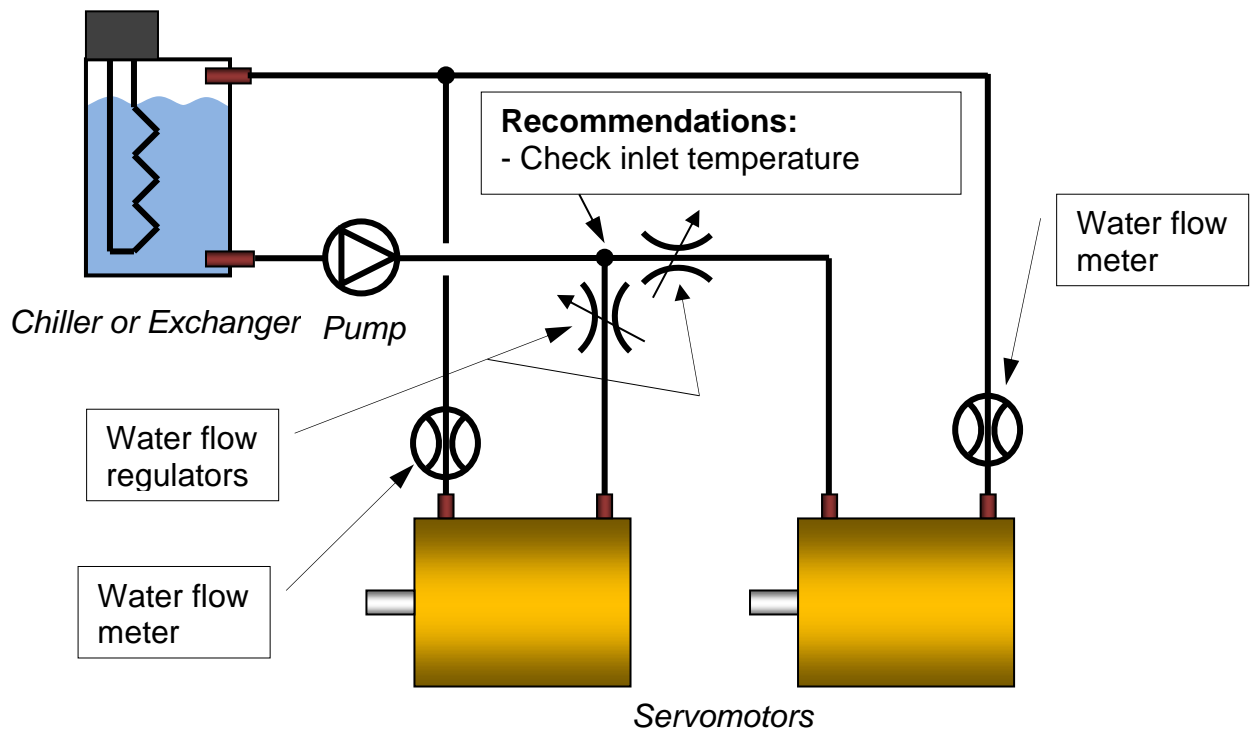

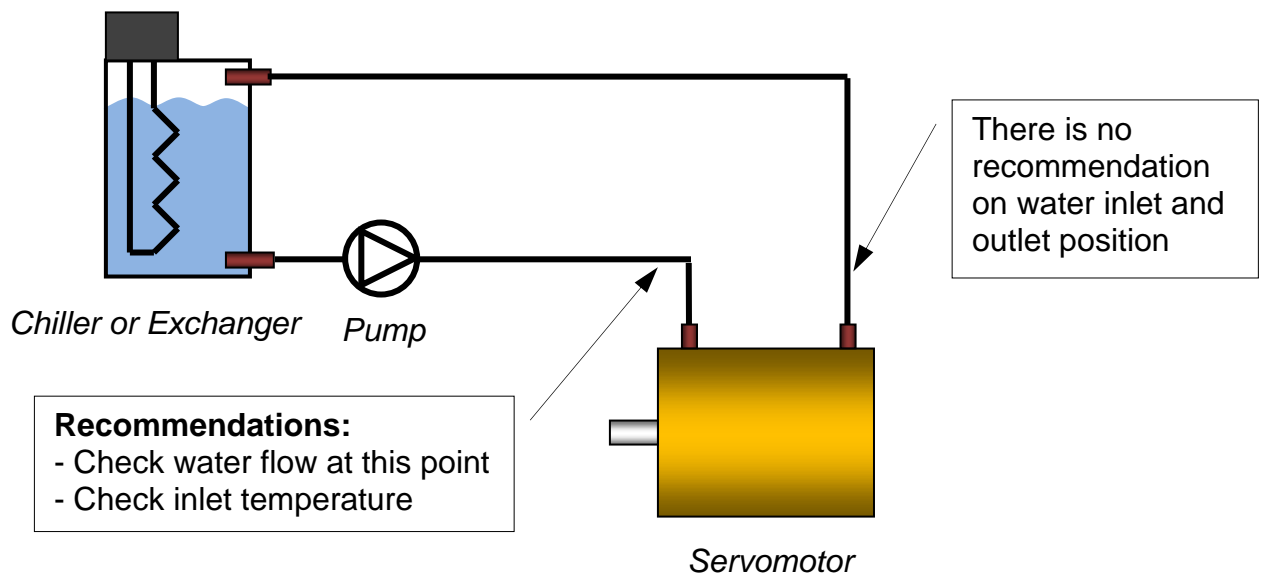

Glycol concentration [%]	Average temperature of the water as coolant [°C]	Thermal specific capacity of the water C_p [J/kg°K]
0	30	4176
30	30	3755
40	30	3551
50	30	3354

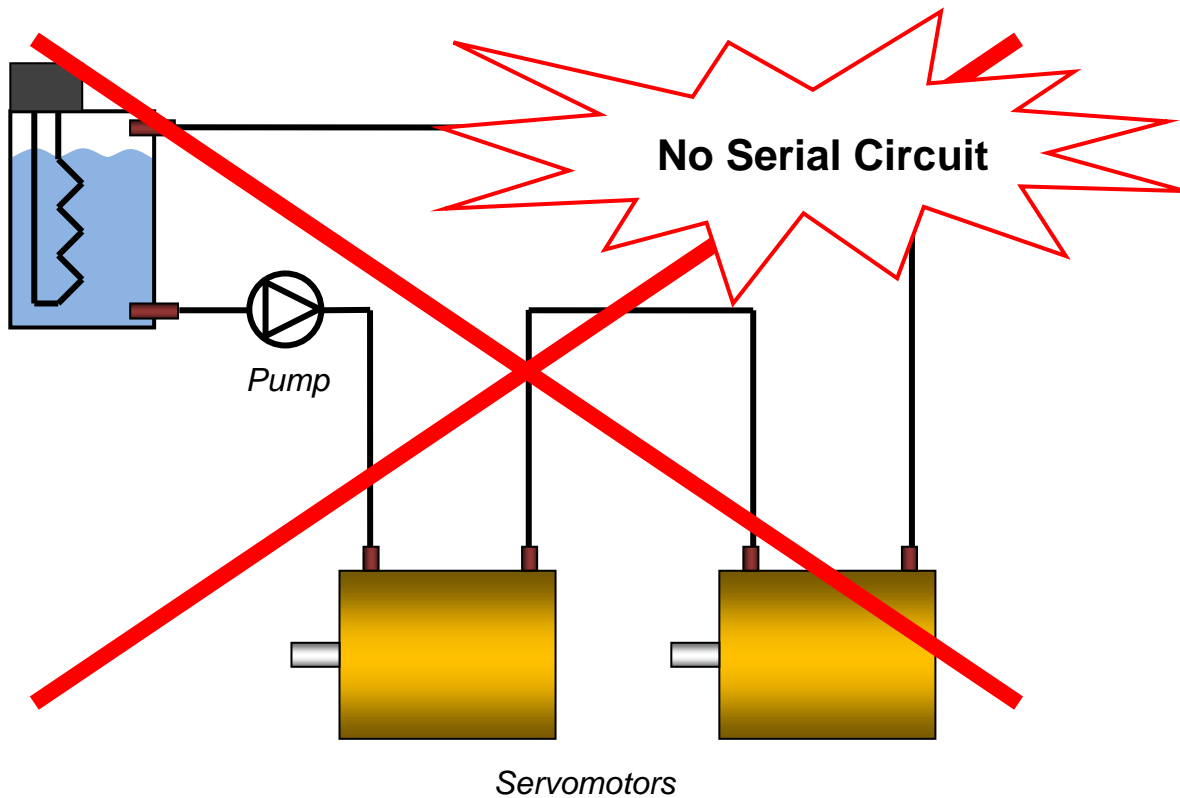

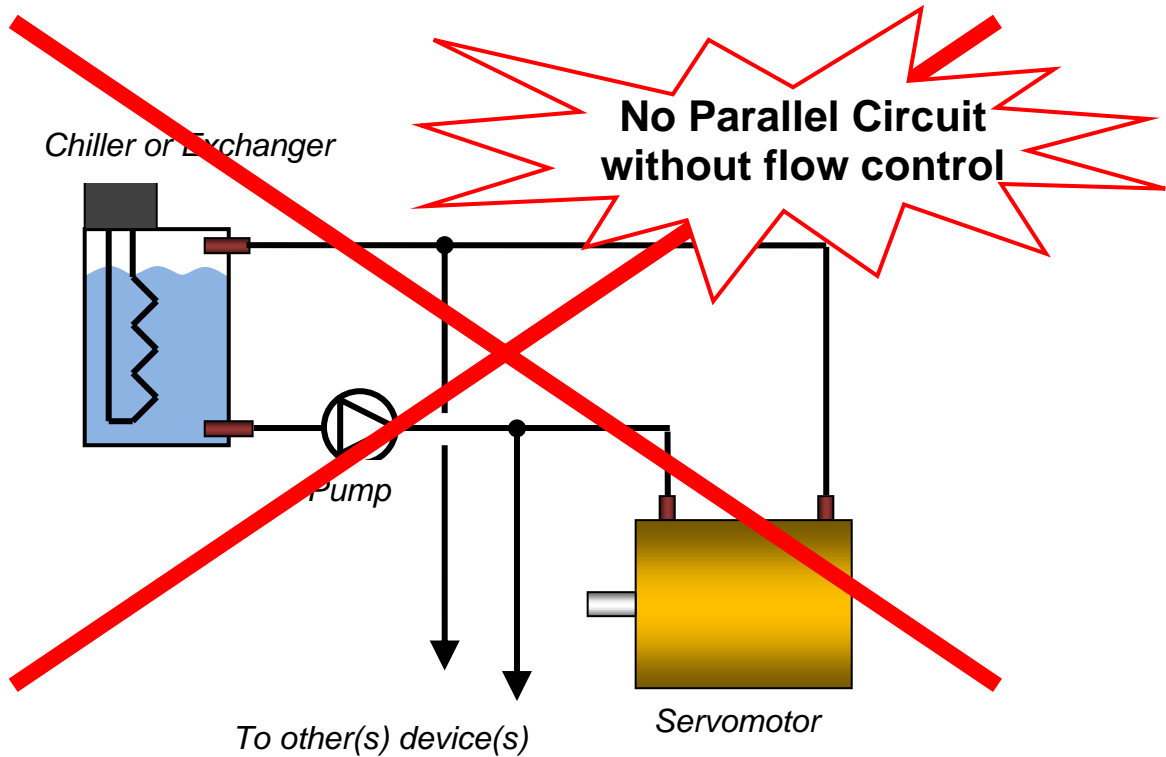

3.6.8. Water cooling diagram

Recommendation: The use of a filter allows to reduce the presence of impurities or chips in the water circuit in order to prevent its obstruction. We recommend 0.1mm filter.

This section shows typical water cooling diagram :

3.7. Thermal Protection

Different protections against thermal overloading of the motor are proposed as an option: Thermoswitch, PTC thermistors or KTY temperature built into the stator winding. No thermal protection are available for the NX1 motor

The thermal sensors, due to their thermal inertia, are unable to follow very fast winding temperature variations. They achieve their thermal steady state after a few minutes.

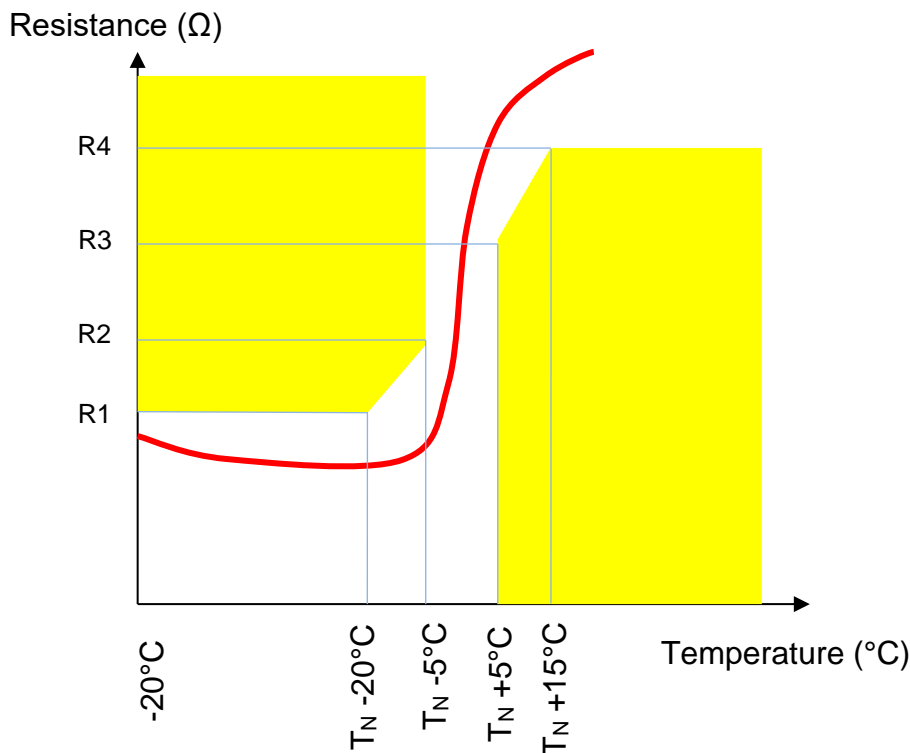

Warning: To protect correctly the motor against very fast overload, please refer to 3.1.6. Peak current limitations

3.7.1. Alarm tripping with PTC thermistors :

One thermal probe (PTC thermistors) fitted in the NX servomotor winding trip the electronic system at $150^{\circ} \pm 5^{\circ} \text{C}$ for class F version. When the rated tripping temperature is reached, the PTC thermistor undergoes a step change in resistance. This means that a limit can be easily and reliably detected by the drive.

The graph and tab below shows PTC sensor resistance as a function of temperature (T_N is nominal temperature)

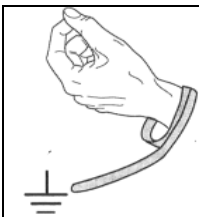

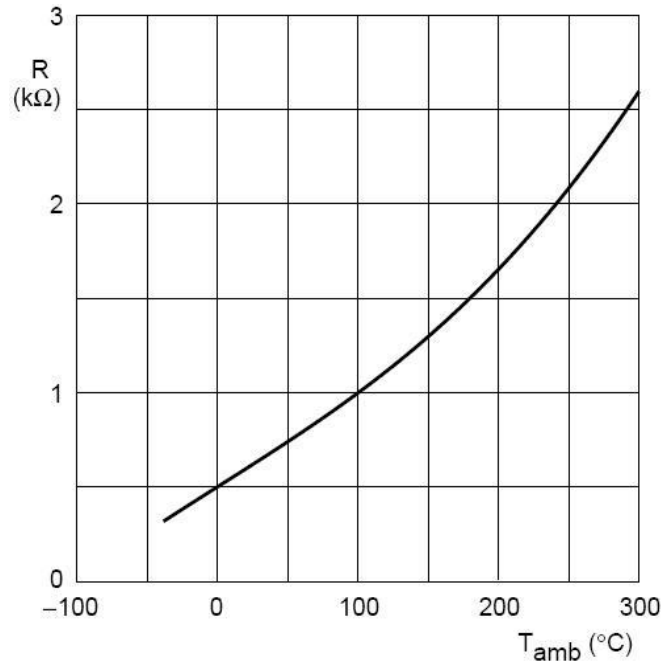

Temperature	Resistance value
-20°C up to $T_N - 20^{\circ}\text{C}$	$R1 \leq 750\Omega$
$T_N - 5^{\circ}\text{C}$	$R2 \leq 1650\Omega$
$T_N + 5^{\circ}\text{C}$	$R3 \geq 3990\Omega$
$T_N + 15^{\circ}\text{C}$	$R4 \geq 12000\Omega$

3.7.2. Temperature measurement with KTY sensors:

Motor temperature can also be continuously monitored by the drive using a KTY 84-130 thermal sensor built in to the stator winding. KTY sensors are semiconductor sensors that change their resistance according to an approximately linear characteristic. The required temperature limits for alarm and tripping can be set in the drive.

The graph below shows KTY sensor resistance vs temperature, for a measuring current of 2 mA:

Warning: KTY sensor is sensitive to electrostatic discharge. So, always wear an antistatic wrist strap during KTY handling.

Warning: KTY sensor is polarized. Do not invert the wires.

Warning: KTY sensor is sensitive. Do not check it with an Ohmmeter or any measuring or testing device.

3.8. Power Electrical Connections

3.8.1. Wires sizes

In every country, you must respect all the local electrical installation regulations and standards.

Not limiting example in France: NFC 15-100 or IEC 60364 as well in Europe.

Cable selection depends on the cable construction, so refer to the cable technical documentation to choose wire sizes

Some drives have cable limitations or recommendations; please refer to the drive technical documentation for any further information.

Cable selection

At standstill, the current must be limited at 80% of the low speed current I_0 and cable has to support peak current for a long period. So, if the motor works at standstill, the current to select wire size is $\sqrt{2} \times 0.8 I_0 \cong 1,13 \times I_0$.

Sizes for H07 RN-F cable, for a 3 cores in a cable tray at 30°C max

Section	I_{max}
[mm ²]	[A _{rms}]
1.5	17
2.5	23
4	31

50	146
70	185
95	224
120	260
150	299
185	341
240	401
300	461

Example of sizes for H07 RN-F cable :

Conditions of use:

Case of 3 conductors type H07 RN-F: **60°C maximum**

Ambient temperature: 30°C

Cable runs on dedicated cables ways

Current limited to 80%*I₀ at low speed or at motor stall.

Example:

I₀=100 Arms

Permanent current at standstill : 80 Arms

Max permanent current in the cable = 113 Arms

Cable section selection = 35mm² for a 3 cores in a cable tray at 30°C max.

You also have to respect the Drive commissioning manual and the cables current densities or voltage specifications

3.8.2. Conversion Awg/kcmil/mm²:

Awg	kcmil	mm ²
	500	253
	400	203
	350	177

20	1.03	0.52
22	0.63	0.32
24	0.39	0.20
26	0.26	0.13

3.8.3. Motor cable length

For motors windings which present low inductance values or low resistance values, the own cable inductance, respectively own resistance, in case of large cable length can greatly reduce the maximum speed of the motor. Please contact PARKER for further information.

Caution: It might be necessary to fit a filter at the servo-drive output if the length of the cable exceeds 25 m. Consult us.

Motor powered by direct current at the current nominal value (W+ et V-), the shift is 90° electrical.

Feedback Letter : R/S

Motor powered by direct current at the current nominal value (W+ et V-), the value in encoder memory is 205

Feedback Letter : T/U

Motor powered by direct current at the current nominal value (W+ et V-), the value in encoder memory is 1638

Feedback Letter : V/W

Engine driven clockwise shaft end side. Switching signal V is in phase with FEM UV.

Feedback Letter : X

Engine driven clockwise shaft end side. Switching signal V is in phase with FEM UV.

3.9. Feedback system

3.9.1. Resolver 2 poles transformation ratio = 0.5 – code A

	NX3	NX4, NX6 & NX8
Parker part number	220005P1001	220005P1002
Electrical specification	Values @ 8 kHz	
Polarity	2 poles	
Input voltage	7 Vrms	
Input current	86mA maximum	
Zero voltage	20mV maximum	
Encoder accuracy	$\pm 10'$ maxi	
Ratio	$0,5 \pm 5 \%$	
Output impedance (primary in short circuit whatever the position of the rotor)	Typical $120 + 200j \Omega$	
Dielectric rigidity (50 – 60 Hz)	500 V – 1 min	
Insulation resistance	$\geq 100M\Omega$	
Rotor inertia	$\sim 30 \text{ g.cm}^2$	
Operating temperature range	$-55 \text{ to } +155 \text{ }^\circ\text{C}$	

3.9.1. Incremental encoder-Commuted lines 10 poles–2048pulses–code X (On request)

	NX3, NX4, NX6 & NX8
Model	F10 (Hengstler)
Type	Incremental encoder with 10 pole commutation signals
Parker part number	220167P0003
Line count	2048 pulses per revolution
Electrical interface	Line driver 26LS31
System accuracy	Incremental signals $\pm 2.5'$ commutation signals $\pm 6'$
Perating speed	5 000 rpm
Power Supply Current consumption (without load)	$5\text{VDC} \pm 10\%$ 100mA
Max pulse frequency	300 kHz
Operating temperature range	$0^\circ\text{C to } +120 \text{ }^\circ\text{C}$

3.9.2. Hiperface encoder singleturn EKS36 DSL SIL2 – code P

	NX3, NX4, NX6 & NX8
Model	EKS36 SIL2 (Sick)
Type	Absolute single turn encoder
Parker part number	220174P0011
Electrical interface	Hiperface DSL
Position values per revolution	4096
Integral non-linearity	$\pm 80''$
Differential non-linearity	$\pm 40''$
Perating speed	12 000 rpm
Power Supply	7VDC to 12VDC
Current consumption	Max 150mA
Output frequency	0kHz – 75kHz
Operating temperature range	-20°C to +115 °C

3.9.3. Hiperface encoder multiturn EKM36 DSL SIL2 – code Q

	NX3, NX4, NX6 & NX8
Model	EKM36 SIL2 (Sick)
Type	Absolute multi turn encoder
Parker part number	220174P0012
Electrical interface	Hiperface DSL
Revolutions	4 096
Integral non-linearity	$\pm 80''$
Differential non-linearity	$\pm 40''$
Perating speed	9000 rpm
Power Supply	7VDC to 12VDC
Current consumption	Max 150mA
Output frequency	0kHz – 75kHz
Operating temperature range	-20°C to +115 °C

3.9.4. Hiperface singleturn SKS36 SIL2 (128pulses) – code R

	NX3, NX4, NX6 & NX8
Model	SKS36 SIL2 (Sick)
Type	Absolute single turn encoder
Parker part number	220174P0015
Line count	128 sine/cosine periods per revolution
Electrical interface	Hiperface
Position values per revolution	4096
Error limits for the digital absolute value	$\pm 320''$ (via RS485)
Integral non-linearity	$\pm 80''$ (Error limits for evaluating sine/cosine period)
Differential non-linearity	$\pm 40''$ (Non-linearity within a sine/cosine period)
Perating speed	12 000 rpm
Power Supply	7VDC to 12VDC
Current consumption (without load)	60mA
Output frequency	0kHz – 65kHz
Operating temperature range	-20°C to +110 °C

3.9.5. Hiperface multiturn SKM36 SIL2 (128pulses) – code S

	NX3, NX4, NX6 & NX8
Model	SKM36 SIL2 (Sick)
Type	Absolute multi turn encoder
Parker part number	220174P0016
Line count	128 sine/cosine periods per revolution
Electrical interface	Hiperface
Position values per revolution	4 096
Revolutions	4 096
Error limits for the digital absolute value	$\pm 320''$ (via RS485)
Integral non-linearity	$\pm 80''$ (Error limits for evaluating sine/cosine period)
Differential non-linearity	$\pm 40''$ (Non-linearity within a sine/cosine period)
Perating speed	9000 rpm
Power Supply	7VDC to 12VDC
Current consumption (without load)	60mA
Output frequency	0kHz – 65kHz
Operating temperature range	-20°C to +110 °C

3.10. Brake option

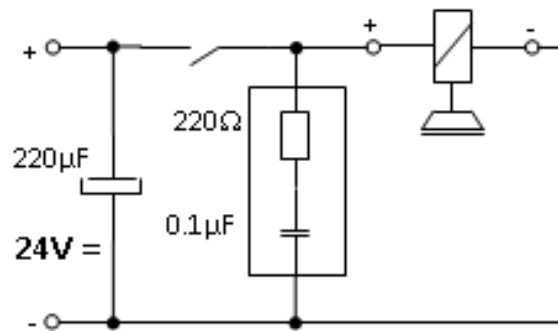

Caution: The holding brake is used to completely immobilize the servomotor under load. It is not designed to be used for repeated dynamic braking ; dynamic braking must only be used in the case of an emergency stop and with a limited occurrence depending on the load inertia and speed.

The standard brake power supply is 24 Vcc DC $\pm 10\%$.

Follow the polarity and the permissible voltage, and use shielded cables.

A 220 μ F capacitor avoids untimely braking if the 24 V voltage is disturbed by the external relay. Check the voltage value once this capacitor has been fitted. The RC network (220 Ω , 0.1 μ F) is needed to eliminate interference produced by the brake coil.

Position the contactor in the DC circuit to reduce brake response times. Follow the connection instructions taking the brake polarisation into account.

Motor	Static torque @20°C (N.m)	Static torque @100°C (N.m)	Power (W)	Engaging time (braking) (ms)	Disengaging time (Unbraking) (ms)	Extra Inertia (Kg.m ² .10 ⁻⁵)	Angular backlash (°)
NX3	2	1.8	11	13	25	0.68	0
NX4	5.5	4	12	17	35	1.8	0
NX6	12	8	18	28	40	5.4	0
NX8	36	32	26	45	100	55.6	0

Table with typical values

4. COMMISSIONING, USE AND MAINTENANCE

4.1. Instructions for commissioning, use and maintenance

4.1.1. Equipment delivery

All servomotors are strictly controlled during manufacturing, before shipping. While receiving it, it is necessary to verify motor condition and if it has not been damaged in transit. Remove it carefully from its packaging. Verify that the data written on the label are the same as the ones on the acknowledgement of order, and that all documents or needed accessories for user are present in the packaging.

Warning: In case of damaged material during the transport, the recipient must **immediately** make reservations to the carrier through a registered mail within 24 h..

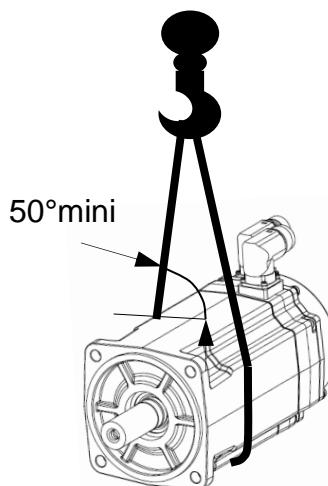

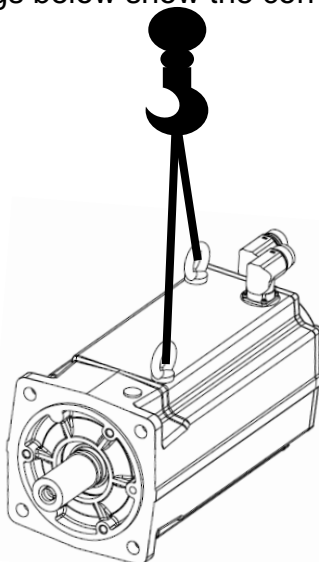

4.1.2. Handling

Servomotors are equipped with two lifting rings intended for handling.

Caution: Use only servomotors lifting rings, if present, or slings to handle the motor. Do not handle the motor with the help of electrical cables, connectors and water inputs/outputs, or use any other inappropriate method.

The drawings below show the correct handling procedure.

DANGER: Choose the correct slings for the motor weight. The two slings must be the same length and a minimum angle of 50° has to be respected between the motor axis and the slings.

4.1.3. Storage

Before being mounted, the motor has to be stored in a dry place, without rapid or important temperature variations in order to avoid condensation.

During storage, the ambient temperature must be kept between -20 and +60°C.

If the torque motor has to be stored for a long time, verify that the shaft end, feet and the flange are coated with corrosion proof product.

After a long storage duration (more than 3 month), run the motor at low speed in both directions, in order to blend the bearing grease spreading.

The motor is delivered with caps for the water inlet and outlet to protect the cooling circuit. Keep them on place until the motor commissioning.

4.2. Installation

4.2.1. Mounting

Foundation must be even, sufficiently rigid and shall be dimensioned in order to avoid vibrations due to resonance. Before bolting the motor, the foundation surface must be cleaned and checked in order to detect any excessive height difference between the motor locations. The surface variation shall not exceed 0,1 mm.

	<p><u>Caution:</u> The user bears the entire responsibility for the preparation of the foundation.</p>
--	--

The table below gives the average tightening torques required regarding the fixing screw diameter. These values are valid for both motor's feet and flange bolting.

Screw diameter	Tightening torque
M2 x 0.35	0.35 N.m
M2.5 x 0.4	0.6 N.m
M3 x 0.5	1.1 N.m
M3.5 x 0.6	1.7 N.m
M4 x 0.7	2.5 N.m
M5 x 0.8	5 N.m
M6 x1	8.5 N.m
M7 x 1	14 N.m
M8 x 1.25	20 N.m

Screw diameter	Tightening torque
M9 x 1.25	31 N.m
M10 x 1.5	40 N.m
M11 x 1.5	56 N.m
M12 x 1.75	70 N.m
M14 x 2	111 N.m
M16 x 2	167 N.m
M18 x 2.5	228 N.m
M20 x 2.5	329 N.m
M22 x 2.5	437 N.m
M24 x 3	564 N.m

	<p><u>Warning:</u> After 15 days, check all tightening torques on all screw and nuts.</p>
---	---

4.2.2. Preparation

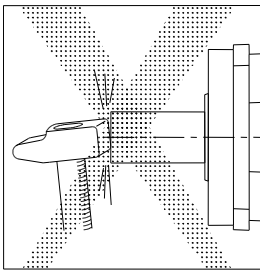

Once the motor is installed, it must be possible to access the wiring, and read the manufacturer's plate. Air must be able to circulate around the motor for cooling purposes.

Clean the shaft using a cloth soaked in white spirit or alcohol. Pay attention that the cleaning solution does not get on to the bearings.

The motor must be in a horizontal position during cleaning or running.

	<p><u>Caution:</u> Do not step on the motor, the connector or the terminal box</p>
	<p><u>Caution:</u> Always bear in mind that some parts of the surface of the motor can reach temperatures exceeding 100°C</p>

4.2.3. Mechanical installation

The operation life of servomotor bearings depends largely on the care and attention given to this operation.

- In the event that the servomotor shaft has a cotter pin, make sure that the coupling components have been balanced correctly without the cotter pin, the servomotor having been balanced with its cotter pin.
- Prohibit any impact on the shaft and avoid press fittings which could mark the bearing tracks. If press fitting cannot be avoided, it is advisable to immobilize the shaft in motion; this solution is nevertheless dangerous as it puts the resolver at risk.
- Use the thread at the end of the shaft in accordance with the diagram for fitting pulleys or accessories. It is possible to put pressure on the shoulder of the shaft located in front of the bearing.
- In the event that the front bearing block is sealed by a lip seal which rubs on the rotating section (version IP 65), we recommended that you lubricate the seal with grease thus prolonging its operational life.
- In the event that the drive system uses a pulley and belt, the drive pulley must be fixed as close as possible to the flange. The pulley diameter is to be selected so that the radial load does not exceed the limits given in the catalog.

	Warning : a misalignment of the coupling device makes stress and load on the motor shaft depending the rigidity of the installation. The variations of the temperature makes stress and load due to the dilatation. These loads (axials and radiale) do not exceed the load written (§ 3.5).
	<u>Warning</u> : The misalignment of the coupling device makes vibration who can realize a destruction of the motor shaft.
	We cannot be held responsible for wear on the drive shaft resulting from excessive strain.

4.3. Electrical connections

	<u>Danger</u> : Check that the power to the electrical cabinet is off prior to making any connections.
	<u>Caution</u> : The wiring must comply with the drive commissioning manual and with recommended cables.
	<u>Danger</u> : The motor must be earthed by connecting to an unpainted section of the motor.
	<u>Caution</u> : After 15 days, check all tightening torques on cable connection.

4.3.1. Cable connection

Please, read §3.7 "Electrical connection" to have information about cable connection

Many useful information are already available in the drive documentations.

4.3.2. Encoder cable handling

	<p><u>Danger:</u> before any intervention the drive must be stopped in accordance with the procedure.</p>
	<p><u>Caution:</u> It is forbidden to disconnect the Encoder cable under voltage (high risk of damage and sensor destruction).</p>
	<p><u>Warning:</u> Always wear an antistatic wrist strap during encoder handling.</p>
	<p><u>Warning:</u> Do not touch encoder contacts (risk of damage due to electrostatic discharges ESD).</p>

4.4. Maintenance Operations

4.4.1. Summary maintenance operations

	<p>Generality</p> <p><u>DANGER:</u> The installation, commission and maintenance operations must be performed by qualified personnel, in conjunction with this documentation.</p> <p>The qualified personnel must know the safety (C18510 authorization, standard VDE 0105 or IEC 0364) and local regulations.</p> <p>They must be authorized to install, commission and operate in accordance with established practices and standards.</p> <p>Please contact PARKER for technical assistance.</p>
---	--

	<p><u>Danger:</u> before any intervention the motor must be disconnected from the power supply.</p> <p>Due to the permanent magnets, a voltage is generated at the terminals when the motor shaft is turned</p>
--	---

Operation	Periodicity
Clean the motor	Every year
Motor inspection (vibration changes, temperature changes, tightening torques on all screws)	Every year
Bearing replacement	Every 20 000h
No water condensation checking for water cooling version	Every year
Cooling water quality inspection for water cooling version	Every year

4.5. Troubleshooting

Some symptoms and their possible causes are listed below. This list is not comprehensive. Whenever an operating incident occurs, consult the relevant servo drive installation instructions (the troubleshooting display indications will help you in your investigation) or contact us at: <http://www.parker.com/eme/repairservice>.

You note that the motor does not turn by hand when the motor is not connected to the drive.	<ul style="list-style-type: none"> • Check there is no mechanical blockage or if the motor terminals are not short-circuited. • Check the power supply to the brake.
You have difficulty starting the motor or making it run	<ul style="list-style-type: none"> • Check on the fuses, the voltage at the terminals (there could be an overload or the bearings could be jammed), also checks on the load current. • Check the power supply to the brake (+ 24 V \pm 10 %) and its polarity. • Check on any thermal protection, its connection and how it is set in the drive. • Check on the servomotor insulation (if in doubt, carry out hot and cold measurements). <p>The minimum insulation resistance value measured under a max. 50V DC is 50 MΩ:</p> <ul style="list-style-type: none"> • Between the phase and the casing • Between the thermal protection and the casing • Between the brake coil and the casing • Between the resolver coils and the casing.
You find that the motor speed is drifting	<ul style="list-style-type: none"> • Reset the offset of the servoamplifier after having given a zero instruction to the speed setpoint input.
You notice that the motor is racing	<ul style="list-style-type: none"> • Check the speed setpoint of the servo drive. • Check you are well and truly in speed regulation (and not in torque regulation). • Check the encoder setting • Check on the servomotor phase order: U, V, W
You notice vibrations	<ul style="list-style-type: none"> • Check the encoder and tachometer connections, the earth connections (carefully) and the earthing of the earth wire, the setting of the servo drive speed loop, tachometer screening and filtering. • Check the stability of the secondary voltages. • Check the rigidity of the frame and motor support..

<p>You think the motor is becoming unusually hot</p>	<ul style="list-style-type: none"> • It may be overloaded or the rotation speed is too low : check the current and the operating cycle of the motor. • Check if the mounting surface is enough or if this surface is not a heat source – see §3.6 cooling. • Friction in the machine may be too high : <ul style="list-style-type: none"> • Test the motor current with and without a load. • Check the motor does not have thermal insulation. • Check that there is no friction from the brake when the brake power is on. • Check the cooling circuit
<p>You find that the motor is too noisy</p>	<p>Several possible explanations :</p> <ul style="list-style-type: none"> • Unsatisfactory mechanical balancing • There is friction from the brake: mechanical jamming. • Defective coupling • Loosening of several pieces • Poor adjustment of servo drive or position loop : check rotation in open loop
<p>The motor is warmer on its top</p>	<p>Air bubbles can be stocked in the water cooling circuit. You need to purge the circuit or to double the water flow rate during 10 minutes to remove the air bubbles.</p>
