1 Introduction

These instructions are to be used as a reference tool for the vehicle manufacturer’s design, production, and service personnel. The user of these instructions should have basic knowledge in the handling of electronic equipment.

Warnings

Sections marked with a symbol in the left margin, must be read and understood by everyone using the system, carrying out service work, or making changes to hardware and software.

The different symbols used in this manual are defined below.

**WARNING**

Sections labeled *WARNING* with a caution symbol in the left margin, indicate that a hazardous situation exists. We use warnings, marked with the warning symbol, in two ways.

- As a strong recommendation about work practices when using the product in the machine (e.g. routines when updating an application). This use is common to the term 'hazardous situation', that a person is exposed to a hazard.
- As a way of pointing out important information for the machine designer that in some way relates to safety. This includes the design of the physical machine, and also the application program being developed for the control system.

Not all document sections that contain information about safety are marked with a warning symbol (there would be warnings everywhere). Failure to comply with the recommendations can cause unintentional, and unexpected behavior of the control system. This can potentially cause death, serious injury or property damage.

**NOTICE**

Sections labeled *NOTICE* with a notice symbol in the left margin, indicate there is important information about the product. Ignoring this could result in less than optimal performance, or damage to the product.

Contact the manufacturer if there is anything you are not sure about or if you have any questions regarding the product and its handling or maintenance.

The term "manufacturer" refers to Parker Hannifin Corporation.
Overview of relevant documentation
The following publications are relevant for users of this product.
The main documentation contains information that is not found elsewhere.
The additional documentation contains product information in a compact format, for
details on the information found in those documents, consult this manual.

The IQAN module documentation system.
2 Precautions

Work on the hydraulics control electronics may only be carried out by trained personnel who are well-acquainted with the control system, the machine and its safety regulations.

**WARNING**
Make sure that you have sufficient knowledge before designing, modifying or servicing the control system.
Read the relevant sections of this document before conducting any work on the control system.

**WARNING**
This product is not field repairable.

**NOTICE**
As much as possible of the welding work on the chassis should be done before the installation of the system. If welding has to be done afterwards, the electrical connections on the system must be disconnected from other equipment. The negative cable must always be disconnected from the battery before disconnecting the positive cable. The ground wire of the welder shall be positioned as close as possible to the place of the welding. The cables on the welding unit shall never be placed near the electrical wires of the control system.

**Read This**

**Design of control system**

**WARNING**
Risk of injury may be introduced by design of control system!
This product is designed to control hydraulic outputs. The control application must be designed using basic safety principles so that unintentional movement is avoided. The machine must be equipped with an emergency stop that stops all movement. Please refer to section "Supply voltage".

**Before you start**
Read this document.
Read the IQANdesign software user manual section on 'application safety'.
Start-up, maintenance, and diagnostics
For all personnel carrying out installation, commissioning, maintenance or troubleshooting.

**WARNING**
Work on the hydraulics control electronics may only be carried out by trained personnel who are well-acquainted with the control system, the machine and its safety regulations.

**Before you start,**
Read section "Start-up".

**Additional information for service**
Mounting and maintenance instruction book.

**Additional information for diagnosing the system**
Read section "System diagnostics", and see "Appendix B", in this document. Use the IQANrun software user manual as a reference.
3 Product description

IQAN-MD4
The IQAN-MD4 is a family of combined display and bus master modules capable of running applications created by IQANdesign software. Built on a 32-bit platform the units have large computational power and is capable of controlling large applications.

System overview
The master module, IQAN-MD4, is the central unit in the system, or in the case of a multi-master system, one of the central units. IQAN-MD4 has four CAN buses and two ethernet ports. The CAN buses support ICP and are able to control IQAN expansion units. SAE J1939 and Generic CAN protocols are also supported on the CAN buses and gives the possibility to interface to 3rd party units.

A touch screen in combination with a graphical display makes system feedback with user interaction possible. The display in the module has very high optical performance across a wide operating temperature range and over a wide range of ambient light.

IQAN-MD4 has voltage and digital inputs that are designed to be flexibly configured using IQANdesign software. The unit also has four low side digital outputs. All I/O are EMI filtered and protected against short circuit to -BAT and +BAT.
I/O

Voltage inputs
The IQAN-MD4 module has two (2) voltage inputs VIN-A and VIN-B for connection of 0-5 Vdc signals. These inputs can be configured as digital inputs for reading switches. Voltage inputs and digital inputs share positions, see below.

(2) Voltage inputs VIN-A and VIN-B
or
(2) Digital inputs DIN-I and DIN-J

Digital inputs
The IQAN-MD4 module has eight (8) digital inputs DIN-A thru DIN-H. DIN-A thru DIN-D are multi purpose and can be configured as low-side on/off outputs. DIN-G and DIN-H are multi purpose and can be configured as a directional pulse count input. see below.

(8) Digital inputs DIN-A thru DIN-H
or
or
(6) Digital inputs DIN-A thru DIN-F, (1) Directional pulse count input DPCNT
Communication

The communication interfaces are used for uploading/downloading applications, connecting to expansion modules, connecting to cameras or diagnostics.

CAN related functions

The IQAN-MD4 uses a CAN-bus (CAN = Controller Area Network) to communicate with IQAN expansion modules and other systems. The CAN-bus is a robust communication protocol that is widely used and well proven within the automotive industry.

The non-touch version MD4-5-T0E1 has two (2) CAN buses, CAN-A and CAN-B. All other versions have four (4) CAN buses, CAN-A to CAN-D. The CAN buses may be configured in IQAN design to be used for IQAN expansion modules, IQAN diagnostic and multi-master traffic, SAE J1939 modules (e.g. for engine and transmission), or as Generic bus for user defined CAN protocol (suitable also for CANopen).

IQAN diagnostics bus

The IQAN diagnostics bus is used for communication between master units in a multi-master system, and also as a gateway to an IQAN-G11 or to a connected PC (requires compatible USB to CAN adapter).

In the IQAN-MD4, the CAN channels are paired in groups of 2. There is CAN-A and CAN-B, where the CAN controllers are in the main processor, compared to CAN-C and CAN-D, that are controlled by the co-processor.

NOTICE

On the IQAN-MD4, the buses CAN-C and CAN-D have a lower throughput rate for bursts of CAN traffic.

It is recommended to use CAN port A or B for diagnostics on the MD4 module, especially in multi-master systems.

Ethernet

The MD4 has up to two Ethernet communication ports depending on configuration, Port A (C3) and Port B (C4).

Port A is used for uploading/downloading applications and diagnostics and is designated for computer communication. see Ethernet diagnostics communication for more information.

Port B is used for in-vehicle network over Ethernet, for example communicating with camera or other masters. see Video input for more information on how to use cameras.

HMI (human machine interface)

Display

Touch function

The IQAN-MD4 display has a capacitive touch screen (PCAP touch screen) enabling the user to control the display with the use of fingers, passive stylus, thin gloves or thicker gloves with conductive material in the finger tips. The touch sensor is protected from wear behind a glass surface.
Landscape and Portrait mode, Polarization
The MD4 software supports both landscape (default) and portrait mode orientation. The MD4-7 (7”) screen has polarizers, and the display component is defined as landscape mode display. In an application where the MD4-7 is used in portrait mode, and when wearing polarized sunglasses, the effect is that the screen can be unreadable due to the conflicting polarizations. This is easily solved by applying a film to the display. One type of film that is proven to work is NuShield DayVue anti-reflective overlay film.
The MD4-5 and MD4-10 screens do not have polarizers.

Scratch resistance
In order to maximize the life cycle of the optical performance of the display, the glass surface does not have any anti-reflection treatment. Such surface treatments have a tendency to mechanically wear down over time and would give a worn out appearance of the display and a reduced optical performance.

Maintenance
Reasonable care should be taken to maintain the glass. The display can be cleaned with an LCD cleaning solution found in many stores. Use a lightly dampened lint-free, non-abrasive cloth when cleaning the display.

NOTICE
To avoid scratches, do not wipe or clean a dry display.

Water
IQAN-MD4 is a hardened module suitable for both in-cab and outdoor use. The display will not be damaged by water, but the touch sensor has been tuned to reduce the risk of unintentional activation of buttons from water drops. The touch interface can have limited functionality if an excessive amount of water droplets remain on the screen. If the MD4 display is placed in exposed locations where water spray can hit the display, additional splash protection could be used.

NOTICE
It is recommended to place the display in a vertical position so that water droplets that hit the display roll off the display glass.

Brightness
The brightness is easily adjusted by pressing the 'menu' touch button and following the prompts to the backlight settings section. The backlight is automatically dimmed at supply voltage <14V.

Image persistence
The IQAN-MD4 TFT LCD, like all other LCD screens, can show image persistence, also known as image sticking, if the same pattern is left on the display for extended periods of time.

NOTICE
To avoid the possibility of image sticking in applications where the display is rarely powered down, a screen saver that alters the display image could be used.
4 Safety

Internal diagnostics
The module performs a number of self-checks that improve safety. Checks include monitoring of voltage supplies, checksums on memory and a watchdog that monitors software execution. The module is using a real time operating system which supervises software execution.
If a critical error is detected, the module is stopped, with CAN-bus and outputs off.

CAN-bus interruption
The IQAN modules communicate on a CAN-bus. Both the master module and expansion modules check for any interruptions in CAN-bus communication. If an error occurs the master will use zero or an application defined error value for the module inputs, and the module outputs will be off.
The error will be presented on the master/display module, if there is one, and with a related blink code on the IQAN module status LEDs, see Appendix B.

Current check
For modules with proportional outputs, when used in current mode a current check is performed. If an error is detected, this will be indicated on the master module, and the output will shut off.
The module can detect open-circuit, short-circuit to +BAT/-BAT or short-circuit to other proportional output and return pins.

Emergency stop

Warning
Risk of injury!
The emergency stop must disconnect the power supply to the module; do not connect the emergency stop as a signal input only.
The emergency stop must be installed so that the risk of reverse feed of the module is avoided, see section "Supply voltage".
5 Mounting

Mounting the module
The IQAN module should be mounted according to the following instructions:

Dashboard or panel assembly
When installing in a dash or panel the recommended panel thickness is 1.0 - 3.5 mm. Use M4 screws to attach the supplied steel clips..

Ball or tilt/swivel mount
The option to use ball mounting or tilt swivel mounting for MD4-7 or MD4-5 display position flexibility is made possible by using Parker’s steel bracket. Use the provided M4 screws to attach the bracket to the display. The bracket will accept Southco or RAM™ mounts.

• The part number for the MD4-7 bracket kit is 20077778.
• The part number for the MD4-5 bracket kit is 20077779.

See ’Appendix C’ for RAM™ and Southco mounting pattern dimensions. The IQAN-MD4-10 does not require a bracket. It has a VESA 75 mounting pattern on the back surface which will also accept RAM™ mounts.
Mounting considerations

**NOTICE**
IQAN-MD4 shall be positioned in the machine per the following instructions:

- The unit is designed for outdoor use. Position the unit in desired location and make sure that it is not exposed to mechanical damage.
- The connectors on the reverse side of the unit should be accessible.
- Position the unit so there is no risk that the cabling can be folded, crushed, worn or damaged in any way.
- Leave sufficient room behind the unit to insert connectors. Less than 75 mm clearance will stress the cabling and distort the seals in the connectors. This can cause the environmental specification not to be met.

**NOTICE**
- Position the unit so there is no risk to be exposed to external heat, e.g. from the engine or heater.
- The best readability will be achieved by positioning the front face of the unit directly towards the operator.
- Extended periods of exposure to direct sunlight can cause an internal temperature exceeding 90°C which may cause permanent degradation of the LCD display.

**NOTICE**
All of the connectors, C1 to C4, must be properly installed in the unit.
- If you leave a connector unplugged, the unit will not be sealed.
- If unused wire positions in a connector are not closed with the recommended plugs, the unit will not be sealed.
6 Installation

Connector C1 and C2

</tbody>
</table>

**NOTICE**

No pin may be "double crimped". That means only one wire may be attached to any given pin. Failure to follow this instruction will cause the module to not meet the environmental specification.

Make "Y" connections or splices using weatherproof methods external to the IQAN-MD4 connectors.

Supply voltage
Before any installation of the IQAN system can take place, make sure the ignition lock is turned off and the battery is disconnected.

Emergency stop
Make sure an *Emergency Stop* disconnecting the power supply, is easily accessible at any time. The figure below shows how to connect the emergency stop.

Connecting of Supply Voltage
The supply voltage, should be within the operating interval, see Appendix A. Connect the supply voltage to +BAT and -BAT. Protect the module by using a fuse. For recommended fuse level, see Appendix A.

RTC supply
IQAN master modules have a clock that is used for date/time stamping when logging data. The *real time clock*, +RTC, requires a separate positive power connection. Connect the supply voltage to +RTC through a 1.5K ohm resistor. The resistor should be as close to the battery as possible for safety. IQAN expansion modules do not have +RTC.

**WARNING**
Risk of injury!
To reduce the risk for uncontrolled supply of an IQAN master module, i.e., a short circuit between the +RTC cable and +BAT, a resistor must be connected between the battery and the +RTC input. This is important as this line is not controlled by an emergency stop.
The resistor should be placed close to the battery, as the ’protected’ part is the cable between the resistor and the unit.
This will prevent the +RTC wire from powering up the unit if shorted to +BAT.

[Diagram showing the connection of emergency stop and voltage supply.]

**NOTICE**
Do not use the chassis as the negative terminal.

Polarity reversal
The module is protected against power supply polarity reversal and over-voltage, provided an external fuse is being used.
If this fuse is not used, polarity reversal can damage the unit.
Addressing

IQAN-MD4 use of an ID-Tag
In IQANdesign 3.0 and higher software, more than one IQAN master module can be used together in a multi-master system. The master modules are each given a unique address by using an ID-Tag. The value of the ID-Tag identifies the master and will enable a single project application to be loaded into more than one master module over the CAN bus. The functionality needed for each master is loaded based on the ID-tag address.

Identification of an IQAN-MD4 by address
For normal operation of an IQAN-MD4 in a single master system, the ID-Tag is still used. When no ID-Tag is installed, the MD4 will start in safe mode. The connection of an ID-Tag between ADDR-H and ADDR-L will assign an address to the IQAN-MD4 master module. The desired functionality based on address is built into the project file using IQANdesign software. For more information, please refer to the IQANdesign user manual. It is the combination of address and module type that gives each master module a unique identification.

NOTICE
When no ID-Tag is installed, the MD4 will start in safe mode.
Diagnostic interfaces

IQAN software includes many tools for tuning, measuring, accessing logs and otherwise checking the performance or troubleshooting your control system. To use the diagnostic tools with an IQAN master module you may choose between different ways to connect to the unit.

CAN diagnostics connection

One of the CAN buses of the IQAN master module may be dedicated for diagnostics. Reserving a bus for diagnostics ensures that signals are not interrupted by other bus traffic. A high-speed CAN interface is needed to use this feature. Contact Parker for information about supported CAN interfaces.

A termination resistor is usually required at the CAN interface on the PC. Parker part number 5030082 or 5030182, or an equivalent 120 ohm resistor may be used. A flying lead cable may be connected to the IQAN master to provide a connector interface. The connection from IQAN master module to diagnostic CAN interface can then be made quite easily. It is recommended that the connector be a sealed, automotive type. When not being used this connector should be protected from the environment with a cover or mating blank plug.

The recommended wiring to the IQAN master module connector is shown below.

Connecting for CAN communication.
**Ethernet diagnostics communication**

The "A" (C3) Ethernet port is used for diagnostic communication or uploading and downloading project files using IQANdesign/IQANrun. On port C3, the IP address is automatically assigned using Dynamic IP (DHCP/link-local auto-IP). As an alternative it is also possible to use IQANdesign to configure the IQAN-MD4 application with a static IP address instead.

It is recommended to use an environmentally sealed panel mounted RJ45 connector for easy access. Parker part number 20077785.

**Video input**

The IQAN MD4 master modules are capable of showing video inputs from an external source. For quality images and easy set-up it is recommended to use the IQAN-SV camera. The IQAN-SV is a digital, high resolution IP camera using an Ethernet video link to work together with IQAN-MD4 master displays. All addressing is handled automatically by IQAN software.

When connecting a video source to the system it is the ethernet port "B" (C4) that is used.

![IQAN-SV camera in a system](image)

**NOTICE**

IQAN-MD4 and the vision system is expandable to 2 camera inputs by also using port C3 (IQAN software 4.02 and newer).

![2 x IQAN-SV camera in a system](image)

IQAN-MD4 and the vision system is expandable to a number of cameras by use of an Ethernet switch.
The C4 port is dedicated for the in-vehicle network (i.e. video input, master-to-master communication). On port C4 when using generic cameras, the MD4 can use DHCP and assign a dynamic address (IQAN software 4.02 and newer). If you use static IP addresses, the generic camera must have a valid and unique IP address set beforehand in order to be used, see IQANdesign manual for valid IP address range.

For information on how to set the generic camera IP address see the camera manufacturer’s instruction book.

**NOTICE**

The IQAN-MD4 use motion JPEG (MJPEG) as video format when communicating with cameras. The type of signal supported is RTSP (real time streaming protocol). A single camera may be connected directly to the unit. The camera must be powered, there is no POE (power over ethernet) available.
Using an ethernet switch it is possible to have multiple cameras connected to one MD4 or to have one static IP address camera connected to multiple MD4 displays.

**NOTICE**
When cameras are assigned an IP address using DHCP, their video stream can only be shown on the MD4 that assigned the address to the camera. The other will have a blank video image. A video stream can only be shared with multiple MD4 units from a generic, static IP address camera.

**Analog Cameras**
It is also possible to connect an analog camera by routing the video feed through a video encoder/server with ethernet connection.
Reference voltage, VREF

The IQAN module is internally equipped with a voltage regulator to generate the reference voltage \( VREF \). The standard reference voltage will feed different kinds of sensors and potentiometers.

On the IQAN-MD4 there is no -VREF pin, instead the -BAT is used as -VREF. To get the best result, connect as close to the connector as possible to minimise voltage fluctuations. In connection examples that follow, -VREF will refer to the -BAT pin.

**NOTICE**

Maximum load for the \( VREF \) is different according to 12/24 Vdc power supply, see "Appendix A".
Voltage inputs

Connecting sensors to the voltage inputs
The sensor signal range must be 0-5 Vdc. To detect signal errors such as short circuits or interruptions the active signal range be within 0.5-4.5 Vdc.

![Graph of voltage inputs with labels: Active signal range, Error detection range.]

The current consumption related to the voltage input is negligible. The positive terminal of the sensor is connected to the +VREF position and the corresponding negative terminal to the -VREF position. The sensor signal is connected to appropriate VIN position.

**EXAMPLE**
Connect the positive and negative terminals of the position sensor to +VREF, and -VREF, respectively. Then connect the sensor signal to VIN-X.

![Diagram of sensor connection to IQAN module with labels: +VREF, VIN-X, -VREF.]

**NOTICE**
The negative terminal of the sensor must not be connected to the chassis. Maximum load for VREF position: see Appendix A.

Connecting other 3 wire sensors
The same type of connection shown for potentiometers is used for other 3 wire sensors supplied with power from the regulated 5VDC supply, VREF. This includes active temperature sensor IQAN-ST, pressure sensor IQAN-SP and Hall-effect levers IQAN-LST or IQAN-LSL.
Connecting a 2-wire temperature sensor to voltage in
When you connect a PTC (positive temperature coefficient) temperature sensor you may need to use a pull up resistor on the input signal. Please check the technical data for your specific temperature sensor.

**EXAMPLE**
Connect the negative terminal of the temperature sensor to -VREF, and the signal to VIN-X. The pull up resistor will be connected between VIN-X, and +VREF.

The pull up resistor value for a R<sub>25</sub>=2000Ω, PTC sensor is 4,7 KΩ.

Connecting switches to the voltage inputs using VREF
Switches could be connected to the voltage inputs, to create a digital on/off signal. The switches should be connected to +VREF and VIN/DIN respectively for 5V signal. The current consumption for the input is negligible.

**EXAMPLE**
Connect the positive and negative terminals of the switch to +VREF, and VIN-X, respectively.

**NOTICE**
Maximum load for VREF position, see "Appendix A".
Connecting switches to the voltage inputs using +BAT

It is recommended to connect system voltage +BAT to the input through a switch in order to reserve 5Vdc VREF for sensors and potentiometers.

**EXAMPLE**

Connect the positive and negative terminals of the switch to supply or the unit’s +BAT, and DIN-X, respectively.

![Diagram of connecting a switch to DIN-X and +BAT.](image-url)
Directional pulse count input

Connecting a directional pulse count channel (DPCNT)
The DPCNT is a physical analog input. The directional pulse count input channel is used to count pulses. It is bi-directional, which means it can add and subtract pulses. The DPCNT is primarily designed for input from an encoder wheel. For maximum frequency, see Appendix A.

Simple directional pulse count sensor
The positive terminal of the directional pulse count sensor is connected to the +VREF and the negative terminal to the -VREF respectively. The sensor signals are connected to the DPCNT+ and DPCNT- positions.

EXAMPLE
Connect the positive and negative terminals of the frequency sensor to +VREF and -VREF, respectively. Then connect the sensor signals to DPCNT+ and DPCNT-.

NOTICE
The negative terminal of the sensor must not be connected to the chassis. Maximum load for VREF position, see Appendix A.
Low-side digital outputs
The low-side digital outputs are designed to drive small loads, e.g. lamps and buzzers. Low-side digital outputs work by grounding a signal through the module. See Appendix A for maximum loads per output.

**EXAMPLE**
Connect the lamp to the low-side digital outputs using a DOUT(LS) position, and the +BAT, as supply.

![Diagram of IQAN module with DOUT(LS)-X and +BAT connections](image-url)

Connecting a switch to DOUT(LS)-X and +BAT.
7 Start-up

Start-up procedures
This chapter contains instructions for action to be taken in connection with the initial start.

WARNING
Risk of injury!
If the control system is not fitted properly, the machine could move uncontrollably. The machine’s engine shall not be started before the control system is completely fitted and its signals are verified.

Starting the control system
Start the control system as follows:
• Prior to start, all modules and cables are to be fitted correctly.
• Check fuses, i.e. make sure that the supply voltage to the modules is equipped with the correct fuse.
• Make sure that connections for supply voltage and return lines are correct in the cable’s conductor joint.
• Make sure an emergency stop is installed.
  The emergency stop should disconnect the supply voltage to all modules. Alternatively, the emergency stop may also shut off the diesel engine or a dump valve, and with that, depressurize the hydraulic system.

Prepare for system start
WARNING
Make sure no one is in dangerous proximity to the vehicle to avoid injuries when it starts.

Prepare for the initial system start as follows:
• The engine for the hydraulic system’s pump shall be in off position.
• Make sure that all connectors are properly connected.
• Turn on the control system.
• Make sure that voltage is being supplied to all modules; the power/status diode shall be illuminated on all modules. Also, make sure that the master is in contact with all modules by reading the master’s display.
• Make sure the emergency stop is functioning properly.

Start the system
Start the system as follows:
• Start the engine for the hydraulic system’s pump, assuming that the above mentioned inspections have been carried out and shown correct values.
Calibrate and adjust input and output signals according to the instructions related to the master menu system and check each and every output function carefully.
Appendix A

IQAN-MD4 Technical Overview

Absolute Maximum Ratings\(^a\)

<table>
<thead>
<tr>

</tbody>
</table>

\(^a\) The "Absolute Maximum Ratings" table lists the maximum limits to which the device can be subjected without damage. **This doesn't imply that the device will function at these extreme conditions**, only that, when these conditions are removed and the device operated within the "Recommended Operating Conditions", it will still be functional and its useful life won't have been shortened.

Appendix B

Error messages and actions
If a fault is detected, a message will be presented on the display.

WARNING
An error message could indicate that a hazardous situation exists. If precautions are not taken, this could result in death, serious injury or major property damage.

Failure Modes
The following tables contain information about the different possible failures that could occur for each module subsystem. In most cases when an error is detected, a message will be presented on the master display. In some cases, the master will turn off or at least shut down the outputs, to increase safety.
